Of course you're right, and that wasn't my intention. I apologise to everyone who had problems reading my earlier message - which was just to say hello really - it seems to have attracted an embarassingly long thread :-)

I thought I had set up Outlook Express to post plain text but it's not the most intuitive product. I have a copy of the ASH Emailer here and I might give that a try but if I do that I can't take advantage of my ISDN line because I don't have the right widget to run IConnect via ISDN (although I understand there is a beta release somewhere).

Fingers crossed I've selected the right options this time!

use
>a SVGA monitor with the machine?
The 13 pin socket is for a mono monitor, typically a SM124/SM125 but you can
connect any S/VGA monitor to this socket using a suitable adapter.
Mario Becroft has recently released his adapters and I have a bunch of them
here to sell at the Neuss show - they work fine and are inexpensive.

11. Major Bug

Newsgroup: comp.sys.atari.st
Date: 1999-04-01 00:00:00 UTC
From: atarimad@zetnet.co.uk
Message-ID: <7duilvlgu2@irk.zetnet.co.uk>
Source record: 81584

I have found a major bug in all Atari newsreading programs. If you read this message before 12noon your system will be infected with a deadly virus that will cause your screen to go blue for no reason whatsoever, even on mono monitors.
It will cause all your RAM and hard drive space to be completely wasted.

Be warned.

AM.

I think therefore I AM.

April Fool :)

I hadn't tried in a month or two, but the last few times I tired, it
was always busy, thought perhaps he was surfing on the same
phoneline he had the BBS on since he probably didn't get to
many calls anymore on Express. I am a registered owner
and enjoy using it from time to time to transfer data to/from
work, etc.

Sounds just like it. Maybe someone should mail it to ROM?
And as I said, if you have extracted everything once, it shouldn't be very
hard to add the changes. After all, I realy doubt that ROM changes the
resource completely between each release.

>>ST+Fanzine "Best ATARI Paper based magazine of 1998"
>As we said in the AC12 news pages "Congratulations"

>I found it hilarious ST Format and other dead magazines still featured in
>the shortlist.

Would this be the same ST Format and other dead magazines that
featured when AC won it and was proud enough to display the logo for a
year...

>> As voted for by the ATARI Community
>[FX uncontrollable giggles]

A♯
AC win the award the previous year and display the award multiple
times on the AC web pages. ST+ response is to congratulate you and
link to you and mention you in every issue

B♯ 1998
ST+ win the current award and display the logo. AC response? ridicule
the award and call it a joke...

I can assure you that if AC are good enough to win the award next
year.. we will not stoop this low..as indeed we never have :(((I am
amazed and deeply saddened by this public attempt to belittle an award
yourselves where quick to accept the previous year.

I don't think it's really a browser because it already existed in HP-Penguin versions just as an html editor .... which was not so powerfull and also absolutely not wysiwyg. But of course it's a really great program !

Just off the top of my head, here, so don't take any of it as an authoritative statement:

AFAIK Atari's in-house hard disk driver stopped development in the age of what we now know as SCSI-1. I think the ICD guys took things up to the threshold of SCSI-2. But I assume that the internal electronics and tight interior space of the Stacy mean that you're stuck with the OEM hard disk controller.

Come to think of it, you might try running a few of the ICD utilities from the floppy and see what controller it is, in fact. One of us from the newsgroup probably has a list of what drive is compatible with what controller.

Much of my main gear is older Atari stuff (typing this on a 1040STe, in point of fact) and my ICD host, the AdSCSI PLUS, can't asee higher than SCSI-1 commands.

Gosh, those older SCSI-1 drives like the Quantum lightning are hard to find, all of a sudden. I imagine that there is a parallel universe of Mac people who still run OS sys. 6.07, remain loyal to their machines, and have bought up all the old Quantum drives...

Anyone succeeded using Ghostlink? My setup doesn't want to transfer any files (Falcon030<->Pentium2PC).

Are there any other apps for transferring files between Atari and pc via serial ports available?

35. HELP: Connection Of Falcon - JAM8 - FDI - CAF2.06

Newsgroup: comp.sys.atari.st
Date: 1999-04-01 00:00:00 UTC
From: escaisey@hotmail.com
Message-ID: <3703a50c.609760058@news.northrock.bm>
Source record: 81608

I need some help with a problem that I have with my Falcon,CAF
2.06,FDI,& JAM8.
I have one of the original 18bit JAM8 and the Steinberg FDI
interface,which was made
by Soundpool.

When I connect my FDI to My JAM 8 And boot up CAF 2.06 the FDI cuts
out the Audio
signal from the JAM 8.But,I can get the digital out from the FDI to
send a signal to my MD player.When I use the Optical Input on the FDI
I get a very harsh white noise sound
with no audio.
Once when I loaded CAF I got one channel from the JAM 8 to work but
the others
did not.I still had a problem with the optical input of the FDI.

When I attach the Cubase Audio Clock Cartridge to the JAM 8 everything
works fine.The Audio is nice and clean coming out of the Jam 8.But of
course I have to use the Falcon's mic input jack to record.

When I attach the FDI to the falcon by itself I can send audio out
through the
optical out jack of the FDI to opitical in jack on my Sony MD player
okay.

When I try to send a signal into the Falcon through the FDI optical
jack all I get
is a harsh white noise.Do You have any Idea what is causing this?

I do not have any digital gear with coaxial connections so I cannot
test these
inputs and outputs.

Also,Does anyone have a Def.ALL song file for Cubase Audio that I
could use that
has the best hardware and Mixer map settings,If so,can you e-mail it
to me?
(I'm not sure if I have the correct settings in the Audio Hardware
section.)

Does Soundpool update the FDI int.PRG?I was wondering if this has
anything to do
with the FDI not functioning properly.

Thanks!

Sean

REACTIONS -till 24/11/98
Thank you for your E-Mail dated 11-12-98 Jos!

THESE STACY'S ARE VERY RARE IN EUROPE
Stacy in the US are Not very rare. Years latter, we still sell them to Atari Midi User's! Matter of face we must still have 50 to 100 2 and 4 Meg Stacys in stock at this time!

I think you are a little confused on this Stacy Battery! All Stacy's have an internal Battery soldered onto the Motherboard for the Internal Stacy Clock! You can not see this soldered in Stacy Battery unless you take apart your Stacy 2!

Now if you are talking about the empty Stacy Battery Pack location behind the Keyboard, Yes, we have 2 Stacy Battery packs in stock! The Gel Cell(Lead Acid type) pack, which requires you cut out plastic inside the Battery compartment to fit the Gel Cell in, cost is U$D75. Then we also have a Ni Cad Battery pack, which is a drop in, no modifications required to the Stacy Battery compartment! Cost is U$D 99
The Stacy Owners manual, which has a Standard Atari ST owners manual and a 12 page Stacy Addendum is U$D 12
Cost for the Stacy Addendum with or without the Atari ST manual is the Same U$D 12.

Regards
Bradley Koda(BEST ELECTRONICS)

The Connection for both of our Stacy Battery packs is located inside the Stacy! You can see the connector on the Stacy motherboard if you Look thru the 3 small Rectangular holes located on the left side of the Stacy Battery compartment! Complete installation instructions come with the Stacy battery packs we sell!

Regards
Bradley Koda

Am interested, I have just soldered on Mario's IDE/TOS2.06 adapter and am running a 2 1/2 inch IDE drive in my Stacy4...

Martin-Eric Racine The Atari TT030/Stacy Homepage with FAQ
FUNKYWARE CREATIONS OY http://members.tripod.com/~TT030/

I also bought a Stacy2 for 2 weeks ago.I have modified it with 2 handmade
SIPP's and a 50 MB harddisk.I contacted BEST ELECTRONICS.Bradley is
a very kind person which has still an enormous amount of Atari parts.
I saw that in a catalogue of his.In this catalogue there are many hints and
tips about Atari computers and.....the Stacy.
When the plans of an Atari-show in Brussels, Belgium are finalized, he's
probably going to that event, and then I will certainly buy this catalogue.
So I read you're modifying your brothers Stacy.I like to read more of that.
But let's start with my question : WHAT'S THE BEST WAY OF DISMOUNTING A
STACY ???
You used a 2.5 inch drive in the Stacy, why not a 3.5 inch SCSI ??
Have you done something about the powering of the Stacy, I mean a batterypack,
that lasts for more than 15 minutes..... or a poweradapter,
that fits in the empty batterycompartment??
Is it possible to use a 1.44 HD drive ??
What's the best harddiskdriver ? I returned after HDDRIVER, ICD and HUSHI
to plain AHDI !!
I already got more reactions on my message in the newsgroup.
I hope we can help each other with question, hints and tips about this
wonderful Atari model.

Brian Becroft replies:

Ours is a Stacy4, Mario will be making his upgrade board to take the RAM
up to 14MB, it is not made yet, only a matter of time...

We have the Best catalogue, it is very good, the best source around and
valuable with the tips in it. Prices are rather expensive... It cost us
NZD36.

BTW, the early Stacy had the Mega bus port out the side. Later models
didn't, but the holes are still there on the PCB...

> So I read you're modifying your brothers Stacy.I like to read more of that.
> But let's start with my question : WHAT'S THE BEST WAY OF DISMOUNTING A
> STACY ???

Taking the Stacy apart is a bit tedious. You have to get the display apart
and the trick is to undo the screws behind the 'Stacy' label. Then the
fiddly bit is carefully unclipping the two halves without damaging the
plastic. We used a small screwdriver to wedge the case in the right way
so the little clipping system holding the two halves together would
unclip! There are a few of these around the display, take it slow and
carefully.

You can either unplug the display to make further disassembly possible, in
this case you need to make a note of where all the wires go. Either way,
you need to unscrew a metal strap to give you more room to move with the
wires - you have to do what you think is sensible.

The first time we did this was because the screen was very loose at the left hand hinge. There is a powerful spring inside and we found the screws coming loose...

However, upon closer inspection we found cracks in the area where there is re-inforcing struts in the plastic, due to stress from the spring. In this case I put a great deal of plastic around all these areas with a plastic glue-gun. I used up a couple of plastic glue sticks. Very worth while.

Another very bad problem can develop. This is chaffing of the wires from the display where they then go through the shielding which sits over the motherboard. I have put special 'pressure-melting tape around the wires in this area. In fact this is the second time I have disassembled the Stacy and this time I am removing some of the shielding to fit the IDE interface and at the same time remove the shielding which causes the rubbing on the display wires...

Another big problem with the Stacy is that the display backlight goes dim. This has happened to me and so I most often use a seperate display. However, the backlight is an electroluminescent type. It is a thin piece of plastic sheeting which glows when the correct type of power is applied. This is why the PSU board which is mounted over the CPU on the Motherboard has additional circuitry to handle this...

I have checked around for replacements but they seem really expensive.

> You used a 2.5 inch drive in the Stacy, why not a 3.5 inch SCSI ??

The Stacy has the Atari SCSI interface plugged in beside the PSU unit. It is not a very good interface. For instance, a friend put a 2 gig HDD in his Stacy and wondered why he could only see 1 gig. The interface is typical Atari, only half done. There are other problems and you can get around them maybe, depending on the drive. Becxause Mario makes the IDE interface which includes the TOS 2.06 upgrade as well, and because the IDE drives are cheaper in the 3 1/2 inch size and about equivalent in the 2 1/2 size - I thought this would be the better way to go. I left the SCSI 40MB drive in there for now and installed his interface with an old 120MB 2 1/2 IDE drive I had sitting around...

I have not researched the battery issue and have given up on this issue. The standard battery replacements are just not worth it in my opinion because they don't last very long at all. The new Magnesium Hydride batteries may be OK, or some expensive Lithium one. I am sure soemthing could be sorted out, but the Stacy has high power consumption and I wonder how long it would go. However, with the 2 1/2 HDD, the power consumption would be a lot lower, so it depends if you want to research this question.

What I did was to leave the SCSI drive in there, and I have really hacked the Stacy case, it may not have been strictly necessary, but I don't mind it. So what I did was to cut the case where the battery compartment is - I cut the bottom out and also the sides a fair bit. This gives me plenty of room to move for the IDE upgrade and 2 1/2 drive. The upgrade actually sits beside the CPU, which in practice, is beside the PSU board, since this sits over the CPU...

I soldered the upgrade directly onto the CPU. This is slow work. It pays to take your time...

Another thing which is a nuisance with the Stacy is the Trackball. The left and right buttons eventually don't work... Well I unscrewed the Trackball unit and very carefully cut open the micro switch itself and cleaned the insides with Isoproypl Alchohol. It's all very tiny. The micro switches are not made to take apart. I put some of this 'pressure-melting tape' I have around the micro switch top and this has held the 'lid' on the little switches just fine. Now the buttons works fine. I must say, however, that I have become a fan of Mario's Serial Mouse Interface. I use a PC 'Genius Netmouse' This has a rocker button for the middle button. This gives me a double click when I press forwards and a left-click-and-hold when I press backwards. It is the best thing ever made for the Atari computers without a doubt - as regards mice, trackballs and pads. It is definitely a 'must have' item. Actually, I can't wait for him to finally make up the PC keyboard/PC mouse interface (I am using this as I speak) as this combines two good things into one. I do find the Stacy keyboard a nuisance when I use it with Notator - It's the little numeric keypad keys and the arrow keys and the 'F' keys they are not easy to oeprate...

It is a great pity that Atari didn't develop the Stacy... I would love to have a ST book, I have a friend who has one, and it is very small.

> Is it possible to use a 1.44 HD drive ??

Yes if you simply put in a new AJAX chip and I think TOS 2.06, or you can risk double clocking your current AJAX chip - some can take it others can't. For peace of mind, get the suitable AJAX chip.

> What's the best harddiskdriver ? I returned after HDDRIVER, ICD and HUSHI
> to plain AHDI !!

We believe HD driver. We have AHDI, ICD pro, CBHD, To get a HDD that is small these days is hard, to get access to multi gigabyte drives with large partitions, well Mario has tested my 12 gigabyte IDE HDD on his IDE interface with HD driver...

regards,

In a word... Y E S !

When I first bought the commercial version of CAB (2.5) I couldn't believe how much better and faster it was compared to 1.5 - which was a buggy, crash-prone mess IMHO. And now I've just upgraded to 2.7 and it's even better still.

If you plan to do your web browsing on your Atari, I would say you're doing yourself a huge disservice by sticking with CAB 1.5.

But as far as who in the UK has the rights, I believe it's System Solutions. But I'm in the US so I can't say for sure.

> IF they do deliver, how can you possibly compare. (besides that, Titan
> says that Tempest will work with Nemesis)...

It's really a question of cost. The C2 is certainly more expensive than the NEMESIS, and the Tempest will no doubt cost even more. I just can't justify spending too much money on my Falcon when I see how much I can get for my money with a PC these days. So, since I still want to keep and use my Falcon [and don't really want to switch to a PC; but need more speed and a higher screen resolution on my Falcon] I was looking for an inexpensive way to enhance it's performance a bit, and the NEMESIS fit the bill.

And, I've been waiting to get one since last August, but Titan kept saying they were out of stock / had more in production, blah blah blah. And I've also been told by Alex at ATY Computer that the NEMESIS is one of the most reliable / compatible accelerator boards available. It comes highly recommended from him (and others I have talked to who have used it). And having dealt with Alex in the past, I respect his opinion and Atari knowledge.

But all is not lost since I've worked out a deal with a Finnish Atari user for his old NEMESIS board and Videlity software - for an excellent price.

So hopefully my Falcon will be Nemisized very soon... :^)

How do you know The Daily Show _didn't_ obtain the rights before hand?

|Well, my question is still pending. Nobody agrees with me?

I'm sorry that I missed the start of this thread (I could not
connect to Zetnet for about a week) but I agree that it would be
better to have one *good* program/stack/whatever for the Atari
rather than several not so good. It may be of course that one or two
are as good as you will ever get but that is perhaps unlikely.

On your utility disc you should have a program called VMG_xxx.PRG
where xxx stand s for your particular card/bus. When you run it you
can then try different resolutions tailored to your particular
monitor.

52. FS: Atari Falcon system [UK]

Newsgroup: comp.sys.atari.st
Date: 1999-04-01 00:00:00 UTC
From: Mark Parry <paz@wile.demon.co.uk>
Message-ID: <ubkyoDAxp+A3EwhF@wile.demon.co.uk>
Source record: 81625

Hello everyone,

Well, it hasn't been easy, but time and financial constraints have
forced me to reluctantly sell my Falcon setup :o(

So, without further ado, here's what I've got:

Atari Falcon030 - With TOS 4.04, 14 meg RAM, 850 meg Hitachi IDE hard
drive, and 68882 FPU.

Hardware - US Robotics Sportster Vi 14.4 external faxmodem,
AST 14" SVGA colour monitor, Epson FX80 b/w dot
matrix printer (with lots of paper), several mouse
mats, two mice (one Atari), durable Competition Pro
joystick, Atari Jaguar joypad.

NOTE: All the above is in perfect working order, and comes
with all the necessary leads, etc. :o)

Software - Over 300 disks (mainly High Density) full of all
the software you could ever need. Including:
Llamazap, Pinball Dreams, Crown of Creation 3D,
Imagecopy 4, CAB 2.5, a complete set of original
Falcon distribution disks (MiNT, SAM, SpeedoGdos,
Atari Works, etc.,), HD Driver v7, UVK 7.1.

Not only all this but a massive collection of Falcon
and ST PD and shareware (many registered titles), and
literally thousands of ZX Spectrum games (with
emulator), plus loads of ST games far too numerous
to list, all in proper drawer-type disk boxes.

Furthermore, I'm also giving away a free ST as part of the deal !*
It is an STFM, TOS 1.04 with 1 meg RAM, again in perfect working order,
and with all the necessary bits.

* The ST isn't compulsory ;o)

I'm looking for 450 pounds for the lot (I don't really want to split it,
unless the offer is too good to resist....), including delivery to
mainland UK. If you're interested, please reply (preferably by Email)
and let me know.

BTW, I'm on the Isle of Wight, so if anyone close is interested and
wants to collect it, the price is 400 pounds.

Thanks,

See ya,

Mark.

P.S. Does anyone know where I can get a decent .MOD file player for the
PC, please ?

Your problem is simple.. I had problems with the JAM-8 out and Steinberg FDI as well, and they were solved by purchasing a replacement chip for the FDI from SoundPool for 20 bit compatibility. It was around $10USD from (the late) Computer Direct, but I'm sure SoundPool will deal directly with you.

It was pretty easy to install if you're OK with a soldering iron.

Hi

I'm trying to locate an Atari disk mag: The Ledger Disk Magazine 10 by
the Untouchables.

The copy I have has been placed on a high density disk, bad move, and
has gone bad (they usually do eventually when written using a standard
720k drive).

In return I am offering 2 disks out of the FORMER LAPD disk catalogue.

This is like a shot in the dark. BUT

ARE THERE ANY ATARI USERS IN SAN JOSE, CALIFORNIA AREA?
How about even SANTA CLARA, CA? (which is where I live)

I am just looking for some local atari users to rap with, exchange
stuff...whatever.

Eveytime I take a walk down the block, I always wonder if anybody in
THAT house or THAT house uses Atari? Or is it all mac and PC?
But you never know. It's Always a small world.

One time I was looking thru my old keyboard mags, read a letter
from a guy who was complaning that keyboard does'nt sopport Atari users
anymore. The guy writting was in Palo Alto. So I called Information,
got the guys number, and asked "Do you use Atari?" (the fatal
question) he answered "OF COURSE!" and we have become good friends
since. He got me on the internet with Cab, turned me on to Dr T Midi
stuff and more. So you never know unless you try! guess I am rambl'in
on. Anybody else with similear stories?

Don't mix up "GEMScript" and the "ASH Scripter". GEMScript ist a
protocol description that's available for free (will be online again
soon on http://www.snailshell.de/GEMScript/, see http://www.mani.de
meanwhile).

ASH Scripter ist a scripting language that can be used to talk to (and
control) other (GEMScript aware) applications via GEMScript.

Hello Everybody,

I'm pleased to announce an anniversary release of Eureka 2.12.
It's a 2D Graph Describer and a 3D Modeller. Some of you allready
know it, but it's improved every monthes since now 3 years.
In fact I'm writing this program since 1987, but it is diffused
on Internet since April 1996. I would like for this occasion,
to thank every people from France, Belgium, Germany, England,
United States, Canada etc ... who contributed to the improvement
of it. That's now a modern software, because it supports OPEN/GL
and produces VRML. There's no doubt that such technologies will
be spread on our ATARI machines thanks to 3D hardware acceleration,
in the near future. Let me know your thoughts, you are welcome !

Thanks,

Bye for now ...

I have the following for items for sale. The only rule is that the Jag, Jag CD, and power pads must go together.
Here then, for your viewing pleasure is my list of Jag stuff. :)

Atari Jaguar with CD and 2 Power Pads, manuals, and boxes.

Cartridge Games:
Alien vs. Predator Cybermorph Fight for Life
Iron Soldier Kasumi Ninja Raiden
Rayman Theme Park Zool2
Trevor McFur in the Crescent Galaxy
Val d'Isere Skiing & Snowboarding

CD Games:
Blue Lightning Myst Vid Grid
BTW, I am not leaving the Atari scene.

Falcon030, 14mb ram, 540mb hd, 17" svga monitor, MagiC, Pagestream, NVDI, ExtedDos Pro, ICD HD utilities.

I was trying to use a standard serial cable for connection of two pc's
(for gaming and data transfer). Is that ok or do I need a special cable?

Ghostlink is a very good tool for file transfer. For that , a special cable is needed a regular cable would not work. I got one at a regular computer store it is a nule cable or "data transfer cable". This cable is very usefull also for using the file transfer program Tranxit for PC.

Nope, there isn't one provided on the system disk. Only one for the ET4000
but not for the ET6000.
The driver for the ET6000 was made by Fredi Ashwanden and not by
Computerinsel.
I ask several times Fredi if he could send me the appropiated VMG but he
never answered to my mails.

We am regretfully selling off our Atari ST software. 8^{(

Here is what the first batch my family has to offer, all prices do NOT include the cost of mailing these items, which the buyer will be asked to pay.

Microprose: Silent Service - $10
SSI: Stellar Crusade $15
SSI: Hillsfar $10
SSI: Star Command $10
SSI: Colonial Conquest $10
SSI: Warship $10
SSI: Phantasie $12
SSI: Phantasie II $12
SSI: Phantasie III $12
all three Phantasie games $25 - they really should be a set. 8^)
Ultima III $12
Great Battles (Austerlitz, Waterloo, Gettysburg and Shiloh) $15
Their Finest Hour, the Battle of Britain $15
Fire Brigade (WW2 East Front) $5
Gridiron (1 or 2 player) $12
Marble Madness $5
Financial Cookbook $5
Sierra: Camelot, The Search for the Grail $10
Epyx: Sub Battle Simulator $10

Please contact us at Wilson_family@juno.com (checked daily) or here at glennwilson@my-dejanews.com (most weekdays).

Gracias.

Not strictly just a mono monitor, my RGB monitor goes in there too,
well I got it on a switcher box with my SM124. Actually my monitor
died last week, and it's in the repair shop now and I don't get it
back until after the hols because the shop is closed until tuesday :(

>connect any S/VGA monitor to this socket using a suitable adapter.
>Mario Becroft has recently released his adapters and I have a bunch of them
>here to sell at the Neuss show - they work fine and are inexpensive.

I wouldn't mind getting one of them, I was wondering though if the
multisync monitor would let you do all 3 ST resolutions?

AM.

I think therefore I AM.

Hallo liebe Atari-Freunde

Ich habe meinen lten Mega ST4 jetzt ausgemottet und mich gefragt, ob man den SLsowieso (Laserdrucker) evtl am PC betreiben kann, da er meiner Meinung nach unter SCSI lief (Jedenfalls ist da so ein K�stchen dran, was zwischen Drucker und ST geh�rt und verdammt danach aussieht). Vielleicht hat ja schon jemand Erfahrung mit sowas gemacht.

Vielen Dank, Matthias Minich

86. FS: ATARI FALCON, INTERNET READY

Newsgroup: comp.sys.atari.st
Date: 1999-04-03 00:00:00 UTC

I need to sell my Atari Falcon which i got a few months ago becuase i need the money to buy a new car.

Hardware includes...
14mb RAM (Which cost me ?100 to upgrade to).
256Mb IDE hard drive.
FPU math co-processor installed.
Microphone IN port adapted to work with Standard Line-IN levels, for HI-FI sound recording.
Monitor adaptor to plug in a TV with a RGB-Scart socket or VGA monitor.
33600Bps Modem, complete set of Internet software, and a account with Freeserve.
2 Mice.
2 Game Pads.
1 Jag Pad.
1 Joystick.
External keyboard (Not connected, I only use the Internal one).
Screen Blaster resolution enhancer.

Software Includes...
STinG Internet connection software, Configured with Freeserve. Just plug into a phone line and your on the Internet.
CAB (Crystal atari browser) 2.7, WWW browser similar to Netscape.
Newsie, News group reader.
Mymail, E-mail Reader.
Atari-IRC, Internet Chat Software.
FTP software.
Xboot, Boot manager.
MaGIC 6 Operating System.
True Paint.
2 CD's of Software.
Papyrus version 4 (english).
Papyrus version 6 (german).
Calamus.
Everest.
Do It Falcon, Hardware manual in HTML.
50 Mb's of Graphics and Sound Demos, And Falcon specific Games.. Including Substation, obssesion, transartica and loads of others.
50 Mb partition of Music and Music software.. MOD Players and loads of Module files. Mpeg2 audio player. Sample editors and recorders.
Videlity video resolution enhancer(Overscan for RGB monitors/TV's)
Orginal atari disks and Manual.
Backward 3 for running ST games.
Kobold high speed file copyer.
Several Doom clones, Doom2 installed.
NVDI 4.11

Harddisk Driver 7
The list of software on the harddisk is just endless!

I bought the computer a few months ago for £300 and I've put in the 14mb memory module for £100. So i'm looking for around £350 for the lot.
I live in Hereford, UK.. You may come and pick up the computer your self or i will post it to you, You pay the postage.

If your interested E-mail me at: Jonny.UK@usa.net
Thanks, Jon.

I've got a pile of Atari ST hardware and software that
I no longer use, and I'm giving it away to anyone who
would like it. The only catch is that you have to pay
the shipping costs. Just drop me an email and tell me
what items you are interested in. If I don't get any
nibbles in the next week or two, it's all headed for the
dumpster, so speak now or forever hold your peace.

If by some miracle more than one person wants a
given item, the winner will be chosen at random
(bribes will also be accepted). All devices include
power and data cables as necessary. Needless to
say, I make no representations or warranties
whatever about any of this stuff. I hope it works for
you, but if not, I don't want to hear about it.

Send email to g.e.cagle@excite.com

Am I the only who uses Telnet regularly and would like to be able to upload and download while connected? I do it all the time with CommNet on my PC, but I have yet to find an Atari equivalent. I belive Peter has refused to update Telstar with this capability. I hate having disconnect from my Falcon, reconnect with my PC just to download a file while using Telnet.

Greg,

I'd be happy to pay shipping for any of the following items
in order of preference. If any are still available
let me know.

Mega ST4 w/TOS 1.04, 4 MB RAM & keyboard
1040 STe w/TOS 1.06, 1MB RAM, blitter
- ICD hard drive kit w/ instructions
(enclosure, controller, no drive)
-- ICD 155 MB tape drive w/software,
19 tapes & cleaning kit
-- Atari MegaFile hard drive (60 MB)
-- Atari MegaFile hard drive (40 MB)

Thanks

Boyd Staley

I used it successfully, I don't know what the model of PC was tho'.

> Are there any other apps for transferring files between Atari and pc via
> serial ports available?

You might be better using PARCP, this transfers over the parallel port
using a slightly modified lead - I bought one at a computer fair, I just
had to swap two wires over in one of the plugs (check that the plugs aren't
moulded!). The software is available at http://www.cyverstrider.org

HTH.

Hi Simon,

>>> See you in Stafford?
>>I'm booking ringside seats - should be fun!
Stafford will definitely be fun but not for Tony because...

>Yes I got the impression he meant something by it as well.. Funny how
>people become so ard in usenet innit..
I meant exactly what I said, I'll argue with you face to face in public,
nothing more, nothing less. It comes as no surprise to me you won't come to
Stafford. I was aware you didn't come to the previous Stafford show but
quite why that precludes you attending this,or any other show, escapes me.

So to summarise your postings to my perfectly innocent root to this thread:

1) You're supportive of Atari Computing BUT:
2) You don't subscribe.
3) You don't attend shows we're associated with.
4) You stick the knife into AC at every opportunity.
5) Your postings WRT AC deliberately misinterpret and misrepresent our
views.
6) Given the opportunity to set the record straight face to face, in public,
you're not up for it.

Hey, I'll even pay for your Stafford entry ticket if it'll make a
difference.

>one... hehe...well ard!
And now we descend to name calling.

Regards

Joe

Just thought I would add my own comments to the Milan/clones/midi solution.

I purchased my 520ST with these strange ports called midi. I had no use for them and if I had a choice like mac, amiga and pc users I would probably have never ordered them. However Atari putting Midi ports was an excellent move. It is the main reason so much midi software was written for the ST. It is the reason there are MIDI GAMES;-). I am not a musician, but I have had the occasional musician drop by, see the Atari, and KNOW what the computer is for. Music obviously. And then they wonder why I know nothing about midi:-). This bold move of midi ports established the ST in the music field.

When one follows up with a clone, it clearly should encompass as much of the original computer as possible. While some technology becomes obsolete and needs to be discarded, midi ports do not fall into this category. They should be part and parcel to the computer. It sends a message to anyone thinking of developing midi software to the clone/atari series that there is a distinct procession from ST to clone.

Musicians thinking of leaving their STs behind because of it being a dead platform may considering upgrading to the clone when knowing that midi is clearly supported and not some mystic artform that can be ordered with the new computer. It was this thinking that held the other computer platforms back.

You could always order midi ports for other platforms, however few users did. Those users who had other computers said they saved on the cost of their computer by not having midi ports.

I disagree. Atari sold more computers because of midi ports and with each computer having midi ports this lowered the overall cost. Midi ports are the reason there is such a significant Atari user base. To ignore midi ports on a platform that established itself with the inclusion on midi ports on ALL of its computers is 100% foolish.

Now this user who in 1985 had no use for midi, will play an amazing game of 6 person midi maze with his only 6 friends:-). He will continue to use the midi ports for networking on his lowly STs. And he will use his last two STs for simple games of STunt Track Racer head to head via the midi ports.

No the Milan isn't an Atari.
It is a clone. And if I were cloned, I would like my clone to be complete and like the original, no matter how bad you might view the original:-).

It is a good thing the milan was not cloned in Scotland, as it would take on the appearance of a sheep with or without midi ports.

The only other thing I can think of is that your chips need reseating. You
may try one of two methods.

1) 4inch drop. Drop the St onto a solid surface from 4 inches.

2) Open the case and press down on all of the chips.

I have 5 STs and have to go through this procedure on a regular basis.

110. ATARIANS OF THE AMERICA UNITE!

Newsgroup: comp.sys.atari.st
Date: 1999-04-03 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <3705D4FF.64AD@geocities.com>
Source record: 81515
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

We've seen the occational message "Are there any other users..."

This tells me that we still long for user groups, and since I am having such a blast (and since Atari is such a cool platform) I would like to fill in the blanks here in the Americas!

In the United States, I find it ironic that all the fandom tends towards the edges of the country. You have two user groups (AUNT, HACE) in Texas, the Pacesetter in Florida, Old Hackers in New York (?) and then the next nearest thing are the clubs in Canada.

What? I didn't list your group? Well, let's fix that!

I want to blanket the United States with Atari fandom. I know the users are out there. Thousands of Atari users, many not connected to the internet.. but they're out there.

So, the thing to do is start a list. From this list we can find people who live near us, and start clubs and user groups.

In 1999? Can you think of a better time?

And from this list we can make a map and show all the locations of user groups across the United States.

TO HELP WITH THIS.. ALL WE NEED IS:

YOUR NAME
LOCATION (City, State)
E-MAIL ADDRESS
COMPUTER TYPE (optional)

As soon as I get 20 names, I will post the URL for the MEGA USER LISTING, so send your info today help get this started. Who knows, someone else might be waiting to start a group up near you!

Sharward Promotions is proud to celebrate its 10th anniversary organising
this popular Computer and Electronics Show in association with Computer
Shopper and Atari Computing magazines.

This twice annual Computer Fair attracts thousands of visitors and dozens
of traders covering all aspects of computing. You'll find stands dedicated
to Computers, Accessories, Multimedia, Satellite, TV, Amateur Radio,
Electronics, Bring and Buy with Atari and Sinclair villages.

Date: Sunday April 18th

Opening Times: 10am to 4pm
Venue: Bingley Hall, Staffordshire Showground, Stafford
Entrance Prices:
Adult: ï¿½3
Children under 14: 50p
Concessions (OAPs, RSGB members, Student Card, UB40): ï¿½2
Advance ticket sales: ï¿½2 plus SAE

Directions:
Stafford County Showground, Weston Road, Stafford
Off A518, Stafford - Uttoxeter Road, signposted from Junction 14 on M6
Bus Shuttle from Stafford Rail Station (this costs ï¿½1 each way)

User Groups welcome with discount stand prices available

For more information, or to book a stand:
Tel: 01473 212113
Fax: 01473 212114
http://www.sharward.co.uk/sproms.html

Sharward Promotions (SAMS '99)
Westerfield Business Centre, Main Road, Westerfield, Ipswich, IP6 9AB

Apart from the dozens of general computer and electronic stands there will
be plenty of dedicated Atari vendors. Here's a partial and provisional line
up so far:

* SysSols
* Titan (TBC)
* Electronic Cow
* ASP
* 16/32
* Portfolio Club
* CyberSTrider
* Falke Verlag (ST Computer)
* Console Centre

* Web.Wizard Matthew Bacon
* HBASIC boy wonder Paul Jones
* Maggie Team
* Atari Computing
* User groups

Hi,

I like the Idea but I think you should make a list of all active users in
the world.

The people just have to subscribe to get on or off the list.

So here is my info:
YOUR NAME Sysop*TXG
LOCATION (City, State) ST. Crispynstr. 4 ,5144RD ,Waalwijk
,The Netherlands
E-MAIL ADDRESS SysopTXG@underground.demon.nl
COMPUTER TYPE (optional) 400/600XL/800XL/800XE/65XE/130XE
PROGRAMMING MAC/65 + ACTION! & Turbo-basic
FAVORITE PROGRAMS PAC-MAN / POLE POSITION
OTHER Running BBS Pro! 5.0b
24hr/7days 300-19200
+31-416-561927
** No download on-line yet...
LOOKING FOR Other BBS systems to network
with.

I had the same Idea several year ago but I had a bad internet connection at
that time, but I think when all
those REAL atari 8-bit users/supporter read this that they should join if
they want to be a community that wants to live on for years.....

Hi Tony,

>>We're talking about two hobbyists magazines, voted for by an Atari diskzine,
>I happen to agree with your view.. however I didnt feel the need to
>insult you when you won it..
Erm, is is just me or isn't the word "Congratulations!" a compliment where you come from? Quite how you can construe anything I posted as an insult escapes me.

>>Now I am accused of having "conspiracy theories" ? I am at a loss as
>to why you keep attacking me like this, what "conspiracy theories" are
>you refering to ?
Don't bother play the innocent with me, I'm well aware what you think of Atari
Computing.

>Can you please tell me what I did to deserve this treatement..
Only if you tell me why I bother replying to you?

>attacking ST+ and Atari Times..
I didn't.

>rediculing both the fanzines and the
>diskzines awards...
I didn't.

>Personally I think you owe all the hard working people and
>contributors of ST+ an apology
None needed. In Atari Computing we include press releases, news and reviews of any disk magazine that sends them to us. Since you are not an Atari Computing subscriber you miss our coverage of these.

>productions.. don't you think its a bit off to just insult them all
>because your maybe having a bad day or somehting?..
I haven't insulted anyone and, not that it's any of your business, I'm having a fine day.

>Hey I know AC put equally as much hard work in..
Equal? Running a small commercial publishing company, like Renegade Publishing Ltd along with all the statutory related office and management tasks is a full time job for two people.

>Or will your response be...
There you go again, putting words in my mouth, you could at least have the courtesy to wait for me to post something before mis-quoting it.

See you in Stafford?

It's more a language prob. Fredi doesn't write English and I can't
write in German. My mails to him were always in English. He maybe thought I
can't read German at all so he didn't bother to answer.

The last time I wrote to him (a couple of weeks ago) about the fortcoming
release of the driver for the ATI PRO RAGE graphic card he did answer
though. He wrote in German but that's is not such a prob as he knows by
now.
Whatever you may think the machine is still supported and I'm very proud
I've such a wonderfull machine. At least I'm still using an Atari(clone).

I apologise for the confusion.

Peter West/TransAction has translated Scripter, programmed by Holger Weets,
and following agreement with Holger, ASH and SysSols there should be an
English Scripter release.
It's also worth mentioning Mark Wherry's freeware Simple Script 2 which
offers GEMScript support.

>You say the above? and then in this post you say it is a full time
>business.. AC also post that they do it for free and also post it is a
>profit making business... isn't it about time you made your mind up.
Once again you're confused.
Renegade Publishing Limited (RPL), trading as Atari Computing, is a properly run commercial business. However, in common with many small businesses, we run the business as a hobby, not to make profits. Our balance sheet will be a matter of public record when our accounts are submitted to Companies House.

>>Erm, is is just me or isn't the word "Congratulations!" a compliment where
>>you come from?
>Well furthur down you point out that I don't subscribe so miss what
>you publish.. so how can I have seen the congratulations?
Erm, because I also repeated it earlier in this very thread.

>All I can see is what you write in here and I found the following (
>amongst other remarks) to be insulting..
The only thing insulted in this thread is my intelligence and that of anyone else taken in by your tedious ramblings.

>sidestepping and back peddling with every post.
Talking of sidestepping, will we see you in Stafford, meeting some of your beloved Atari community?

>Ho dear.. You have no idea what I think.. I have always publicly
>supported AC..
Gee thanks. If threads like this are your idea of public support I'd rather you supported us the same way other people do - by taking out a sub and coming along to the shows, but you won't do that will you?

>Just because I have the gumption to question the
>content does not mean I have any dislike for AC..
Why not bring along that gumption to SAMS '99 where I'll be happy to discuss anything you like face to face and in public?

See you in Stafford, Sunday April 18th?

In the interests of avoiding further unnecessary verbal exchanges I will assume that you have accidentally misunderstood what Joe said here. I will keep my sentences short and simple so there is no possibility of you or anyone else misunderstanding them.

ST+ and Atari Computing are both hobbyist magazines, ie: magazines for people whose hobby is Atari computers.

ST+ is run as a hobby.

The "staff" of Atari Computing are unpaid, therefore we run Atari Computing as a hobby. There is no conflict between this and the fact that the publishing company is a commercial business which was established on the advice of accountants.

Atari Computing is a profit making business (However small those profits are). If it wasn't we couldn't produce the magazines that people have ordered and paid for. It is NOT a profit motivated business

Profits are used by the magazine to further the cause of Atari users by funding various projects.

> Hey I don't mind inconsistances.. but two opposites in one week?... so

I believe that you have simply misunderstood what was previously said.

> which is the truth and which is the lie.. I mean it surely can't be a

Therefore an apology from you is appropriate for this accusation I think?

> Well furthur down you point out that I don't subscribe so miss what
> you publish.. so how can I have seen the congratulations? I mean come
> on Joe it doesn't take a rocket scientist does it?

1) Bought a single copy of the mag at a show

2) Read a friends copy

3) Subscribed under a different name (You last subscribed up to and including issue 3 as Tony Greenwood)

4) Bought a single copy from somewhere else

5) Had part of the magazine "quoted" to you

6) You read earlier parts of the thread which mention the congratulations

etc etc

To quote you again ;-)

> it doesn't take a rocket scientist does it?

Come and talk to us at the show and we can have this out without annoying
and boring everyone else.

Al Goold
(speaking personally, and not as the "official" AC spokesman etc etc)

Hello everyone,

Well, it hasn't been easy, but time and financial constraints have
forced me to reluctantly sell my Falcon setup :o(

So, without further ado, here's what I've got:

Atari Falcon030 - With TOS 4.04, 14 meg RAM, 850 meg Hitachi IDE hard
drive, and 68882 FPU.

Hardware - US Robotics Sportster Vi 14.4 external faxmodem,
AST 14" SVGA colour monitor, Epson FX80 b/w dot
matrix printer (with lots of paper), several mouse
mats, two mice (one Atari), durable Competition Pro
joystick, Atari Jaguar joypad.

NOTE: All the above is in perfect working order, and comes
with all the necessary leads, etc. :o)

Software - Over 300 disks (mainly High Density) full of all
the software you could ever need. Including:
Llamazap, Pinball Dreams, Crown of Creation 3D,
Imagecopy 4, CAB 2.5, a complete set of original
Falcon distribution disks (MiNT, SAM, SpeedoGdos,
Atari Works, etc.,), HD Driver v7, UVK 7.1.

Not only all this but a massive collection of Falcon
and ST PD and shareware (many registered titles), and
literally thousands of ZX Spectrum games (with
emulator), plus loads of ST games far too numerous
to list, all in proper drawer-type disk boxes.

Furthermore, I'm giving away a free ST as part of the deal !*
It is an STFM, TOS 1.04 with 1 meg RAM, again in perfect working order,
and with all the necessary bits.

* The ST isn't compulsory ;o)

I'm looking for 400 pounds for the lot (I don't really want to split it,
unless the offer is too good to resist....), including delivery to
mainland UK.

I'm on the Isle of Wight, so if anyone local(ish) is interested and
wants to collect, then I'd be willing to part with it for 325.

If you're interested, please reply (preferably by Email) and let me
know.

Thanks,

See ya,

Mark.

Not all that servier really... I have all the things setup....

Stik (newest version)
Cab 1.5 (hey, it's free)
Newsie
Cab.OVL

Alright, all has been setup and worked fine under a mint system
Falcon. Myself, I'm using a 520 ST upgraded to 4 megs.

I load Qdialer, and the file goes through the login prcess just fine.
It dials, send the login and password... and then .. does nothing. I'm
not sure but I think it locks up.

What are we single tos folk supposed to do at this point?

Message-ID: <HWEN2.165$MC.56722@news2.randori.com>
Source record: 81467

Just got Mario's Serial Mouse Interface for my Atari. Works great!! The main reason I purchased it is that the usual solution for using a serial mouse by plugging it into the modem doesn't seem to work for Notator.

Anyway, I no longer have to worry about replacing my mouse with an Atari compatable one. I can just go down to my local computer store and get me a serial mouse which are usually quite cheap. :-)

I'm in America, so I bought it from Ken Macdonald in Canada. I'm not sure, but I think Mario has at least one dealer to cover most areas of the civilized world.

Unfortunately, Mario's site seems to be down or I would point you to it. Does anyone know if he's moved his site?

I cleared up a point that you seemed unwilling or unable to answer in a
public discussion. You inferred that you were a subscriber and you made a
statement suggesting that Joe was less than clever. I simply posted some
other options and included simple facts.

> I hope your apology for disclosing my personal subscription details is
> just as public.

I have nothing to apologise for Tony, nor will I do so for this. I have
stated a fact. Actually several facts, but you've chosen not to respond to
these other facts. Why? Is it because they make your "arguments" appear
fatuous?

If we *have* to have another of these dreary threads can we at least try
to deal with facts please?

Al

Das geht meines Wissens nach nicht direkt da dieses "SCSI" nicht dem
Standard entspricht. Den PC mit dem Atari per Nullmodemkabel verbinden
und den Atari so als "PrintServer" verwenden geht allerdings schon.
Da gibt es auch Software dazu, wenn ich mich recht erinnere.

Nennt sich MagicSLM oder so ï¿½hnlich.

Source record: 81474

Hi there,
i've been using my atari 520 for a few years now, mainly for making music
recently my monitor went up in smoke
finding one is a hard case
only a day a go a bought an 1040 and an ST4 from a guy for a really good
price. There was a commodore Amiga monitor (color) with it. The monitor
seems to work fine on the 520,1040 and st4.
Some games i got along a really nice.
The problem hower is that when i startup my cubase 2.0 i only get a 1/4
(quarter) of the original cubase screen.
it seems like the screen is blown up to four times the monitor size
since i have a few gigs/concerts coming up soon i really need
my cubase working again.
can anybody help me with this problem?
regards
Kris.

Hi.

It's down to the screen resolution you're in. The Amiga monitor (or at least the older ones) will only do low and medium, whereas your previous monitor was probably one of the Atari hi-res types.

I can't remember if Cubase will run in medium-res; check your desktop settings then save the desktop prefs to the Cubase boot disk.

Carl.

>from my Falcon, reconnect with my PC just to download a file while
>using Telnet.

Hi Greg!

I use Telnet quite a lot, but mainly to use Multi User Dungeons (MUDs). I use Telstar under StiNG too. It would be great if Telstar had ZModem capability as I would start to use BBSes in the States etc more than I do now, as I would be able to message and get files more easily.

If you were to change to I-Connect, then you could use Teli, which is much more modern than any other Telnet app on the Atari, but I don't know if it handles file transfers though. Anyone else know?

It would be nice if you could use a comms program like Connect as a Telnet client, but I don't think that is being updated anymore.

Cheers!

James

Hi Kevin!

See Matthew Bacon at the show, he's recently released Web Wizard, which is very similar to HPP, but produces far superior results (in my opinion)!

In fact I've used it as a base to produce my own website, which will be online in a few days, look out for my announcement in here and in Zetnet Atarians etc.

Cheers!

Hi Kris!

Unfortunately, you need a monochrome (hi-res) monitor, not a colour one.
Cubase on the ST only runs in high resolution 70hz mode, the colour
monitor only does low and medium resolutions 50/60hz modes.

Try a free ads newspaper, you probably will be able to find a few for sale
cheaply in the Music sections.

Cheers!

Better way is to lift chips from socket, clean up any pin, replace chip
into socket. Try to restart the machine.

Some do, some don't. The NEC 2D used to be the favourite for Atarians
as it would do all res. with no problems. They are a bit difficult to
get hold of nowadays.

A standard, cheap (free if you're lucky) VGA/SVGA will also work with a
simple adapter. I know Mario Becroft sells these. It's also easy (and
cheap, if you can purchase the connectors locally) to build one yourself.

Want the truth Tony? If any of us did AC for profit there would
never have been another issue of AC after #7! There's not enough
money made from AC to pay wages let alone make a 'profit'!!! And if
any of the AC team claimed all the expenses we incur through our
involvement with the magazine we'd have to shut up shop!

>>will be a matter of public record when our accounts are submitted to
>>Companies House.
>
>It became a matter of public business when a member of AC told this
>newsgroup AC was profit making.... I suggest again that you have a
>little meeting and get your stories straight..

Ah, the big secret was let out of the bag by me wasn't it!

Or was it?

The real truth is that if you were a subscriber to AC Tony, you
would have known that AC was being published by a commercial company
well over a year ago. In issue 8 of AC we told ALL our subscribers
the new publishing arrangements. You were quite obviously not a
subscriber to AC when you commented to the posting of mine regarding
this because it wasn't exactly some big secret - ALL our readers had
known this fact for over a year!!!

You try to 'expose' my comment as some big secret slipping out -in
fact it was year old stale news!

Any commercial company makes a profit (or in theory should). The
difference between us and other companies is that our 'profit' goes
straight back into the magazine and keeps it going long after any
'real' commercial company would have pulled the plug. I think you'll

find that some of the Atari commercial vendors take the same attitude to us. Any profit they make from the Atari scene goes back into the scene - the likes of Titan and TUS don't survive on profits from the Atari scene, yet they continue to provide a valued service long after it was commercially sensible to do so.

I don't pretend to know, or have any real interest in how ST+ is funded or operated, but unless you are a properly set-up club or company you are on very dodgy ground. AC is properly set-up and that cost a lot of money, and continues to do so.

AC has never ever criticised ST+, yet you seem to think it okay to knock us and anyone else that you fancy a go at. If we ignore your postings you accuse us of ignorance and elitism, if we respond with simple facts you start nit-picking. Isn't it about time you actually told everyone why you hate AC so much???

You think you're a very important person on the Atari scene, so how about telling us what you actually do in practical terms to keep the scene alive?

When are YOU going to organise the best Atari show for years (ACC'98), which was organised by Joe Connor almost single-handed?

When will YOU sponsor programmers to make good quality software?

When will you scour the UK and abroad and make excellent quality commercial software available at cost price to readers?

When will you produce a CD-ROM which has full versions of superb quality commercial and shareware software and tonnes of other stuff on it and then sell it at a low price?

In short Tony, AC has done all this. So how about YOU doing something useful as well?

Or are you just content to sit back and knock anyone that does something positive?

Your world awaits Tony!

Kind regards

Mike Kerslake

The STFM rcajack output is RF on channel 3or4. it is not video but a tv
signal that goes into the antenna input of a tv set. You should have a
switch box to convert it to either a twinlead or 75 ohm coax connector but
you can fudge as the cable is 75 ohms and you can kluge a connector for it.

NVDI costs, right? And MAgic. Adds up nicely :/ What is COPS?

>1. Geneva/TOS
>This is an oddity in that it is only co-operative multitasking, but you can

Like oild GEM. Hmm. No desktop with it, though, so its really not
much use until you do get a Gemini-happy desktop. What is most popular? If

Which OS is most popular? Thats th eone to use, whichever it is..

>between them where it doesn't matter if background processes seize up),
>though I'm going on hearsay here as I haven't used it. It certainly has its
>fans, and has a reputation for being very compatible.

How well does Geneva handle OS/TTP programs?

>to STs as it is quite frugal with RAM if you use the supplied Magxdesk
>desktop, and it replaces the whole of TOS (TOS effectively just acts as an
>OS loader at bootup). It also has the advantage of accelerating STs

How much RAM does it just coisume, to hold the OS and Magxdesk?
(is Magxdesk useful?)

None of the OSes support ppp/slip, right? Its external apps,
totally?

(aside: Whats the most popular development kit these days.. gcc,
with some gem libraries and resource editors? ie: what was CAB written
with?)

>3. MiNT with replacement AES
>MiNT on its own won't multitask more than one GEM application. It doesn't
>replace all of TOS, so without a multitasking AES it uses the old TOS GEM

Again.. ramwise.. how much gets consumed by mint, and a 4.1 AESD
of some sort? I'm an old unix lad, so mint ought not to frighten me, as
long as there is *some* documentation available.

>It also has a Unix mode, where you are effectively running a Unix system
>with Atari compatibility: this lets you run all sorts of ported Unix net
>stuff, for example. There are various distributions, such as the TAF package
>and KGMD (both a bit out of date, I gather), including some semi-commercial
>packages such as MiNT98.

Is mintnet documented anywhere? Any idea (guess?) how much ram
mint + mintnet + a shell woudl consume? Is 2 enouygh to get mint going,
some basic networking up and running, and then an app or two?

Jeff

179. "Drive Not Responding"

Newsgroup: comp.sys.atari.st
Date: 1999-04-05 00:00:00 UTC
From: Lou Lew <loulewlj@gte.net>
Message-ID: <7eb9a3$h8v$1@news-2.news.gte.net>
Source record: 81346

Hi,
I've got an Atari 1040 STe, and it had been working fine, but now the internal floppy drive is not happening. At first, I would get the "drive not responding" warning, and then after it "warmed up", it would start to work. Now, it still attempts, but just the warning. (BTW, I had been using high density disks on this double density drive. Was that a big mistake?)

Is the drive shot? Or is there something I can do? What should I check, clean, or tinker with?

If it is shot, does anyone know where I could get a replacement drive (cheap)?

Thank you very much,
JL

Jeff Mitchell <skeezix@loner.icomm.ca> wrote:

> I'm an old Atari man and wanted to fiddle around with some of the newr
> applications that've come out..

If you're mainly interested in GEM-apps all the current popular OS would perform well, in real life they only differ in how they're configured and maintained. MagiC is very MacOS-like, i.e. it's rather easy to set up and configure but there's not many options to play around with. Geneva is extremely configurable, you'd probably like that one :-) MiNT/N.AES is perhaps the most flexible of them all, but be prepared to mess around in various configuration-files with an editor.

> I'm interested in screwing around with Mint to see if I can get an
> X11 setup going. That would impress the hell out of me. Since theres no

X is very easy to set up (download the TAF distribution), but the speed won't impress you.

> ethernet for the ST, it'd have to run over the serial port, which would be
> slow.. but amusing :)

I've actually used this to run Netscape over a 14k4 modemlink on a 4Mb Falcon ;-) It worked, but it took almost five minutes to open one browser-window...

> How much RAM does MagiC take up, minimum?

Just the bare essentials? Perhaps 600-700Kb on a plain ST. It depends on the version, newer versions use more. MagiC 4 is actually a very nice platform on a standard 8MHz ST with no frills. MagiC6 (I never tried 5) is too bulky on my Mega.

> Seems Geneva is a small footprint, which is good. Neodesk might be

Geneva is a *very* nice AES on smaller machines. Highly configurable, small, fast, compatible, cheap, free updates...

> slick, but I've never heard of Thing or the others that've come out
> freeland..

Download the latest version of Thing and be impressed. It's simply the best desktop around, not only for TOS but on all platforms I've ever tried. Only Jinnee-fans would question that ;-)

>>want to run GEM-apps go for MiNT/N.AES. It's very stable and fast, but it
>>takes some effort to install and configure if you want to go all the way

> Is there documentation? Since I'm a unix guy, Mint shouldn't be
> hard to get working. I don't know anythign about it, right now, though..

There's a lot of documentation, but it's not exactly organized... There is
a documentation-directory on Piwo though, try looking under
MiNT/documentation (or whatever) in the Piwo-mirror on
ftp.funet.fi/pub/atari/

> Is there a port of Emacs for mint?

Ofcourse :-) And all the other horribly perverted editors you expect to
find on a unix-box... Btw. there was a message on the MiNT-list a couple
of days ago that a fully working, free ext2fs-driver for MiNT was ready
for beta-testing.

> Since its free, I guess it shoudl be my first choice, and see how
> it goes.

Beware that N.AES is commercial, so you have to buy that part. Everything
else is free though. And you don't need an AES to play with the
unix-stuff.

on Mon 05-04-99 20:46 Jeff Mitchell wrote:

> How much RAM does MagiC take up, minimum?

Hi Jeff,

well, let's try to be practical: I run a TT with 4 megs ST-RAM and 64 megs TT-RAM. Once ready to run apps, I have left 3706 kb ST and 59171 kb of TT RAM. Then MagiC 5.01 is running, plus Freedom, Menuinfo, ST-Guide, Bubblestuff, Popfold, Calendar, Multistrip, Thing 1.27 desktop, including a screen piccie.

Running about the same stuff with Mint/N.AES eats more, about 1/2 to 1 meg. Then Multistrip is replaced by Taskbar, but I don't think that makes the difference.

Generally speaking, I'd say the Mint/N.AES stuff is more RAM-hungry.

> Seems Geneva is a small footprint, which is good. Neodesk might be
>slick, but I've never heard of Thing or the others that've come out
>freeland..

Well, Thing is shareware, it's not completely free. Although, unregistered it has very few limitations. It's ONE FINE PIECE of desktop software, to be honest, I wouldn't like to miss it in any case...

The effort to install and configure is mainly for the complete setup, i.e. Mintnet etc. If you do Mint and N.AES only it's not a big deal. But no Unix stuff either then...
>
> Is there a port of Emacs for mint?

Really don't know, one might expect but I'm not sure about a Mintport. Probably others who know...

Firstly, where in this WIDE, WIDE world are you?

If you are getting the drive error when reading the HD disks, then that
IS your problem. I don't recommend anyone use High Density disks in
Double Density drives. The data isn't secure, take my word for it;)

If it gives errors using DD disks then there can be a couple of reasons
for it. Dirty heads, dust or drive failure are just a few.

Hi,
Thanks for the quick response!

I'm in California (where, you'll be happy to know, it's cold and rainy).

I'm getting the error whether I'm using high density disks or double
density. But I was wondering if using high density disks are actually
bad for the drive.

So if I clean out the dust, etc., and that doesn't fix it, should I
assume the drive is bad, and therefore start hunting for a new one?

Thanks again,
JL

Unfortunately, you can't use ftp on sites such as internatilnal BBS's, Delphi, etc. For that you need a Telnet client which supports downloads.

Based on some suggestions, I will try CAB's I-Connect Telnet client and see. I think it's just a VT-52 terminal window however.

Greg

Having tried both products and compared them with the Joe HTML editor and modules I prefer to use Joe. It's suitable for anyone except absolute beginners and the modules, which can be run as standalone applications, are excellent - especially the table creator.

Joe is Freeware, the modules are shareware and the English releases will be supported via InterActive.

Hi Tony,

>I ask again.. Joe Conner..
It's Joe Connor.

>Why did you think that ATARI Times award
>was an honor to receive and prestigious enough to place multiple times
>on the AC web site for a years and print all about it in AC when you
>won it... But tell everyone what a joke it is when ST+ wins it..
I didn't anwer the question in detail because it was so wide of the mark I didn't know where to start but since you're obviously desperate for a detailed
rebuffal here it comes...

Atari Computing is naturally pleased whenever it is awarded anything positive.

Bob Paton has sole control over our web pages and looks after them in his spare time. The extent of my involvement with our web pages over the last two years has been to say, at least twice now, "Keep up the good work" so whatever is online is his choice not mine, nor Mike's nor anyone elses.

When you say "Print all about it in AC" you haven't got a clue what we published have you? For your information, and other non-subscribers, we ran almost identical news items for the Atari Times awards both years running and I personally congratulated ST+ on the best paper magazine award.

If you read the thread again you will see I did not "tell everyone" the award is a joke. I mentioned once in this backwater of a thread, in this backwater of a newsgroup, that I found it hilarious dead magazines were voted for. I found it just as hilarious last year but since I wasn't in this newsgroup then it obviously didn't come up in conversation.

IME your postings neither invite nor deserve detailed replies. Every reply to you takes time away from the positive things I do for the Atari scene to which AFAIKT you contribute nothing apart from bad feeling.

See you in Stafford?

Regards

Joe

This deserves a question.

Is there a Band in the box user Newsgroup?

Or do you propose posting to THIS newsgrp which I think would be
frowned upon..(no binaries files)

However I belive that Atari users of Band in the Box should sopport
each other, as only ver 5 is available for our platform .

The real meat in the program IS user styles. That is where the
Algorithmic possabilities can occur.

Comments?

Cubase will not work in ST medium. Only ST High. So when you try to
display in Med res, you get the wierd sizing problem.

What you need is a ST High Res emulator. Sebra is a good one. look on
the Atari FTP sites under emulators. Hallvard recently posted his list
FTP list a few days ago. Check it out.

Hi Roger,

>>I wouldn't mind getting one of them, I was wondering though if the
>>multisync monitor would let you do all 3 ST resolutions?
>
>Some do, some don't. The NEC 2D used to be the favourite for Atarians
>as it would do all res. with no problems. They are a bit difficult to
>get hold of nowadays.

Surely you mean the NEC 3D? AFAIR the NEC 2D couldn't handle the ST high resolution.....
The NEC 4D, AOC 346, SONY 1435 and CTX GL 300 can also display the three ST resolutions. There was also a NEC GS which could display the three resolutions in gray scales. But like you said, they are difficult to find and when you do find one....they have a long life behind them....

IMHO the solution I posted a couple of days ago, is the better one. With a VGA Tuner you can enjoy the three resolutions on all new monitors. A brandnew monitor doesn't cost that much anymore these days and the picture quality is much better also. Another advantage is that a lot of the new monitors also have speaker build in, with the NEC 3D ect.. one had vision but no sound...

If one is willing to spend a bit more money he could even attach the tuner to a LCD Screen or a 21" monitor....
Just imagine: switching between Papyrus and the Teletubbies, takes just a twist of a switch.-)

Using Katherine Ellis words : "Lets move on..."-)

Cheers from Belgium
Dennis

$ 4.00 Warship (Strategic Simulations, Inc.)
$ 3.00 Winter Games (Epyx)
$ 3.00 World Games (Epyx)
$ 3.00 World Karate Championship (Epyx)

SPECIAL: Buy one (1) of each listed title and receive 10% off.

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.20 for the first game and $1.10 for each additional game. Shipping for hardware and accessories depends on the distance that the order must travel. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

Michael J. Novak Jr.

But you so obviously do, because you've made such a big fuss about us being a 'profit' making company! Do we question you about the profits you make from your web design services? NO, of course not!

> I have no problem with AC..I have no intention of arguing with you.

I'm not arguing with you, just putting the simple indisputable facts in front of you, which you try to ignore when it suits.

>You are fueling an argument that does not exist , I am going to
ignore
>your insults and refuse to be drawn into such pettiness. I am sorry to

What insults? This is the usual tired response when you can't find fault with the true facts of the matter.

And we're still waiting to hear all about the positive things YOU do for the Atari scene BTW. And while we're at it let's take ST+ out of the equation completely, after all we don't see any hostile postings here from Rich and Gordon, and they were quite happy to sit and talk with Joe and I and the rest of the AC team for hours at ACC'98 and eat the sandwiches AC provided in the room that we paid for and made available to ANYONE irrespective of what organisation, company or magazine they represented. Rich and Gordon (respectively ST+'s editor and layout person BTW for non-ST+ readers) were more than happy to accept our hospitality and thanked us for providing it and for organising an excellent show. We were very glad to see them there and Rich made most of AC team a cuppa the night before as we were all setting up our respective stands! There is no rivalary or animosity between AC and ST+ AFAIAC.

However, at the end of the day this whole thing boils down to you persuing some personal vendetta which you have already privately told me the cause of. It's nothing to do with two totally different magazines and their respective hard-working teams is it, it's YOU feeling aggrieved over something that happened years ago at the very confused start of AC!

Again I ask you to publically tell everyone the cause of your anti-AC feelings. I respect your privacy and right to remain silent on this point, but perhaps revealing it might help others to understand why you dislike AC so much?

>None of your post has anything to do with the problem other than I
>suspect trying to take us away from the truth..

Eh, what!!! Do you really sincerely believe that everything anyone connected with AC says is all part of some sinister conspiracy? All of the AC team are individuals with often widely differing approaches, we don't sit here for hours concocting little plots to ensnare you in, or holding committee meetings on how we are to present the 'party' line to the masses. You might like to dominate and control your own personal little world, but that isn't the case here where you must allow other individuals to state their case without fear of ridicule and unwarranted hostile responses. This is Usenet not some Fascist virtual state! FYI I have had no contact at all with Al or Joe about this thread or anything else, we're all too busy getting on with our real lives to worry about plots, sub-plots, black propaganda, disinformation, misinformation, dead letter boxes, safe houses, secret houses, James Bond, etc etc.... ;-)

WRT to your question to Joe:

>Please don't change the subject this time.. you have already got Mike
>worked up and got Al in a lot of trouble...

Tony, you haven't got me worked up at all, however I'm so sorry that you don't find me worthy of your undoubted wit and intelligence, I guess that just stating some simple facts and asking you to provide proof of something positive that you do doesn't give you much to go on does it? Facts and truth are so boring aren't they?

But it's not good manners to include questions for other people in responses supposedly to me is it? As you so often take others to task for infringements of netiquette etc I am rather surprised at your lapse here. Let us hope that this doesn't happen again.

Kind regards

Mike Kerslake

209. UTSI update news

Newsgroup: comp.sys.atari.st
Date: 1999-04-05 00:00:00 UTC
From: tos4ever@ping.be
Message-ID: <3708bdf23e0abf0@ping.be>
Source record: 81419

Hello,

There are now 1120 program listed in the Ultimate TOS Software Index AKA
"UTSI".
Since the last update I've added 10 new entries of which I can only
remember 9

AUDIO/MIDI *SC55*: MIDI editor for Roland SC55 synthesizer

GRAPHICS: *MUHWIE*: ASCII-art player

PROGRAMMING: *TT-DIGGER*: TT-Digger is a program designed for digging in existing
software,
for instance: TOS-ROM.

UTILITIES/DIVERS: *AB040FIX*: Patches many applications to work better on
the AB040. A list of patched prg's (e.a. Cubase Audio
Falcon) is included

INFOMAT: Show system informations like coookies, free memory, etc...

JULIADRESS: Address database with phone options

XINFO: eXtended data INFormation. Very powerfull
tool. After a long time of silence the author is
working on XINFO again.

UTILITIES/DRIVERS: *NOVA266*: Nova Graphic Card driver for the Afterburner 040

NOVA_SW: Small patch for NOVA users using TK 4.09 (68040 ToolKit)

I've also corrected a few not working links but unfortunately there are
still quite some non-working links.

Please report me every dead link which isn't marked already as dead. Also
if someone know the new URL of the dead links please let me know. I'll
correct then ASAP.

TIA
Martin

I think the problem may be STiK: AFAIK it only does SLIP (ie not CSLIP or PPP) and many ISPs only do PPP now. You'll need to change to STinG if you want to use a PPP connection.

Was the MiNT system actually using STiK to dial into the same provider (in which case something else is wrong)?

Or was it using MiNTnet (which does PPP) or using STiK with a different provider (who provide SLIP as an option)?

BTW what is Qdialer? Is it the STinG-similar STiK dialer by Peter Rottengatter or something else?

212. TT technical stuff

Newsgroup: comp.sys.atari.st
Date: 1999-04-05 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <3708b90c521940@holleman.demon.nl>
Source record: 81422

Hi,

I've used this rainy second Easter day to do some maintenance again on my system. Took the TT completely apart, removed heaps of dust etc and while doing so I noticed several items that ask for explanation.

So this one's for the TT (technical) experts:

1. Just in front of the printer port, there are 3 connectors on the mainboard, a 4-pin J602, a 10-pin J606 (?) and another 10-pin J902. I gather J606 and 902 are the serial port connectors. Mine have been removed. In fact I do need them operational again because of future expansions. Are there connectors ready available? What is the J602 for?

2. Just left of the terminator sockets is another connector, J102. What is this one for?

3. The speaker is hooked to J803, a 3-pin connector, but only 2 pins are connected. You can hook it to the upper two pins, or the lower two ones. Anyone knows details?

4. Below the lower left corner of the ST-RAM board are 3 jumper sockets,
W603 (here set on the lower position),
W601 (here set on the lower position), and
W602 (here set on the upper position)
You guessed it, what are these for?

5. Finally, the J203 or dipswitch. I've got nr. 7 "ON", the rest is "Off". What are the various numbers doing in fact? I gathered one is for DD/HD floppydrives, but I don't know which one and I forgot about the others.

BTW: contrary to what I've said before, this one's got a Motorola 68030 inside, not an Intel one (I've got a friend with an Intel-made 68030 in his TT).

Meanwhile the system is up and running again.

213. Whats the best OS?

Newsgroup: comp.sys.atari.st
Date: 1999-04-05 00:00:00 UTC
From: skeezix@loner.icomm.ca
Message-ID: <7eaies$2qpc$1@hub.org>
Source record: 81423

OKay, I'm flamebait for this one ;)

Whats the most conveniant OS to run on an ST? I'm not into music, if that matters. I was an old time Atari man from way back, with a many-year hiatus.. I used Mint way back when it began, before it was really useful. It woudl appear to be a big contendor these days..

What OS choises are there? MagiC? Geneva? MultiTOS? Mint? (Is multitos just mint?) OS9? (always cool, but nowhere to find it now, for the ST) Anything others?

Geneva seems not too bad, and reasonably inexpensive. Decent package if bundles with Neodesk4... but is that too much RAM consumed on a 2mb ST? What about the others? Opinions? Comparisons? Is there a FAQ?

Jeff

>>But you so obviously do, because you've made such a big fuss about us
>
>So me repeatedly saying I don't is to be ignored ?

You can't say one thing and then change tack and pretend otherwise!
YOU are the one that appeared to be so upset when you 'revealed' that
AC is a profit-making company and then harped on about it a few
months ago in this newsgroup - personally I am upset that it doesn't
make a real profit, because then I could be reimbursed for the
thousands of pounds I have spent or lost during my involvement with
AC. Please note I have no wish to 'profit' from AC or the Atari scene
before you start going down that path, just reimbursed my expenses!

>The fact is I do not have any bad feelings towards AC. Full stop!..Any
>comments made in this thread have been "responses to questions".. It
>would seem that if you don't like the response then you call it an
>attack...hmmm..

In the past you have made certain allegations and ill-informed
statements, I have answered these with the facts, you grudgingly
accepted most of my responses for the truth that they were. I am not
attacking you, I am responding as always to your statements with
facts and simply questioning why you continue to attack AC for no
other reason than a personal one which should have been buried in the
mists of time!

Even though you had a personal apology and explanation from me WRT
the 'real' reason that lies behind your attitude to us last Summer
when you finally told me of your 'problem' with us, you simply cannot
accept this as a suitable and genuine conclusion to the whole affair.
Instead you carry on sniping at us, and you will obviously not be
happy until you completely destroy AC and probably pee-off many
decent Atari users into the bargain. I include in this some people
that you probably regard as your 'mates', one even told me how he
groaned every time he saw one of your anti-AC postings and assured me
that he didn't go along with what you were saying.

For someone that professes to love the Atari scene and has
self-appointed himself as its moral guardian you aren't doing a very
good job are you?

>I don't personaly subscribe or read it because there
>is nothing in there for me personally.. Is that so strange or hard to
>come to terms with...

Not at all, but that's not what lies behind your attitude to AC is it? If you find nothing of interest in AC for you, then that's fine, you're probably not alone. But we don't see other ex or non AC readers continually popping at us at every opportunity do we?

>I will not respond to your recent postings because they are aimed to
>provoke. Anyone with half a brain can see that.(Cue childish remarks)

You won't respond because you cannot face simple facts. By not answering or responding to me you will leave others to draw their own conclusions. Only you see provocation at every turn, but then again it's a convenient wall to hide behind isn't it? You continually provoke others, not just me and AC, yet they respond to you, they don't run away, they argue their view/case here in public. Are you so superior to the rest of us Tony that you won't debate things in such an open and fair way?

>Be honest. read your last post.. what on earth was running through
>your mind?

I am simply trying to get you to see things for what they REALLY are, not what you appear to think they are.

You told me yourself in the ST+ mailing list last year that you always found me truthful and straight in your dealings with me, there has been no change in my behaviour I'm happy to say.

Kind regards

Mike Kerslake

Yes, one of ST+'s team, but only WRT rivalary.

A simple examination of the contents of the respective magazines soon
showed that there was no way we could be construed as rivals - two
entirely different publications. A fact accepted and acknowledged by
me and the ST+ person

End of discussion......

Hi Greg,

Try ftp. You can do it with NEWSie - it's the simlest way.
The another solution is GAPFTP.TTP by Gary Priest.
It features very powerful scripting capabilities, that allow totally
automated uploading/downloading of files.

Hi all,
A unique chance to own a bit of rubbish/history (delete as required).
10 bound vols of the "Home Computer Advanced Course", over 1900 colour pages covering computing in the 1980's. Includes items on Atari (8&16bit)/BBC/SPECTRUM/MAC/C64/ORIC/MSX/ and some rather exotic machines from those innocent times. Everything from game reviews to teach yourself machine code. Helpfull advice such as "don't pick too high a resolution monitor as by blurring the pixels a more pleasing picture is achieved". It will make you laugh and cry! Just 10pounds, if you want it posted it'll be 20pounds.
Regards, Steve.

What do you want to use it for? If you simply want to run GEM-apps in a convenient way, use CAB and a e-mailer I'd say MagiC is your best choice. Geneva is also very good, it's very stable and very compatible with older apps. The downside is that you're a bit restricted (GEM only) with these, and MagiC is expensive (the updates too).

If you're a hacker and want to play around with the OS itself and still want to run GEM-apps go for MiNT/N.AES. It's very stable and fast, but it takes some effort to install and configure if you want to go all the way with a unix-like setup. It's a lot of fun to hack around though, and it performs very well compared to MagiC and Geneva.

Hi Jeff,

Jeff Mitchell wrote in message <7eaies$2qpc$1@hub.org>...

> OKay, I'm flamebait for this one ;)

You do realize you've just opened the gates of hell, don't you? :-)

Before anyone stars blowing fuses, what follows is all IMHO and YMMV drastically.

> Whats the most conveniant OS to run on an ST? I'm not into music,
>if that matters.

It does: the most common MIDI apps (Cubase and Notator) really don't get on with the newer OSs. I think most people would boot plain TOS for those apps rather than struggling.

> I was an old time Atari man from way back, with a
>many-year hiatus.. I used Mint way back when it began, before it was
>really useful. It woudl appear to be a big contendor these days..

It's now very usable, but you need add-on software to make it really usable for normal Atari apps (see below).

> What OS choises are there? MagiC? Geneva? MultiTOS? Mint? (Is
>multitos just mint?) OS9? (always cool, but nowhere to find it now, for
>the ST) Anything others?

To get the really obscure out of the way, there was a brief thread here a short while back which mentioned esoterica such as OS9 and SMS2 - do a search on Dejanews for it to find out more.

I'm assuming that you have a hard drive: if not, I'd say you were better spending money on that initially as you'll miss most of the benefits of an OS upgrade without it. That said, if you have TOS 1.0 you will probably have problems with a hard drive and 1.2 isn't much better by all accounts unless you have patches installed. In which case upgrading the OS becomes more urgent.

For general use things boil down to two main divisions:

a) Single tasking

TOS: if you have a reasonable version (ie not 1.0 or 1.2), you could do worse with limited resources memory-wise. If you have 2 megs, adding in a replacement desktop would be a good idea - I'd recommend Teradesk, YMMV. TOS 2.06 and later has a reasonable desktop (Newdesk) anyway.

b) Multitasking

Firstly, I'd hesitate to recommend multitasking in less than 4 megs, not because it won't work, but because you'll have so little memory left for apps once the OS is loaded that it isn't worth it. It depends what you want to do: you might get away with one main app and a couple of utilities, but anything more ambitious could be a squeeze. It could be more useful for net access, where some of the apps such as POPwatch and NEWSwatch are quite small and it's handy to run them in parallel.

As a guide: on my 4 meg STE with MagiC5, NVDI4, STguide and COPS loaded as accs, I have just over 2 megs left for apps once booted. I'm sure it could be increased by reducing the size of NVDI's caches etc, but you can see why I think you might be squeezed in 2 meg.

That said, here are the options:

1. Geneva/TOS

This is an oddity in that it is only co-operative multitasking, but you can run it over MiNT to get full pre-emptive multitasking. Under co-operative, a program can hog the processor, stopping background processes from running. This may be a problem for some people, not for others. Geneva/TOS is more suited to task switching (ie running more than one program and switching between them where it doesn't matter if background processes seize up), though I'm going on hearsay here as I haven't used it. It certainly has its fans, and has a reputation for being very compatible.

2. MagiC

I'll declare a bias here: this is my OS of choice, and particularly suited to STs as it is quite frugal with RAM if you use the supplied Magxdesk desktop, and it replaces the whole of TOS (TOS effectively just acts as an OS loader at bootup). It also has the advantage of accelerating STs (compared to TOS) when running just one program. It lacks some MiNT features which upsets some people, but generally these things are rather esoteric and for *most* purposes you won't miss them. Compatibility isn't bad but there are some programs it won't get on with and others where it's on the edge. Most recent apps will be fine. I hasten to add that this is the case with most replacement OSs - older programs were not designed to be multitasking friendly and are always going to be problematic.

3. MiNT with replacement AES

MiNT on its own won't multitask more than one GEM application. It doesn't replace all of TOS, so without a multitasking AES it uses the old TOS GEM and that's limited to single tasking. It will, however run lots of text apps and background processes so this kind of setup has its uses.

It also has a Unix mode, where you are effectively running a Unix system with Atari compatibility: this lets you run all sorts of ported Unix net stuff, for example. There are various distributions, such as the TAF package and KGMD (both a bit out of date, I gather), including some semi-commercial packages such as MiNT98.

To run multiple GEM apps, you need a multitasking AES. Here are the choices:

i) MultiTOS (AES 4.0). This was commercial from Atari, and is slow and buggy.

ii) AES 4.1. This was Atari's followup to MultiTOS which was never finished/released. It's faster, but has a whole load of bugs of its own. Technically this is unreleased commercial software, but you can find it on the net.

iii) Geneva. Geneva/MiNT isn't supposed to be too stable, but some people have found it works to their liking.

iv) N.AES. This is the finished commercial AES4.1 (unless I've misunderstood), and is available from Germany. Comes with the Thing desktop and has a very good reputation. The one to go for in teh MiNT world, by all accounts.

v) Freeware AESs: oAESis and XaAES. Neither of these is finished or really usable, and both seem to have died as projects - curiosities, really.

> Geneva seems not too bad, and reasonably inexpensive. Decent
>package if bundles with Neodesk4... but is that too much RAM consumed on a
>2mb ST? What about the others? Opinions? Comparisons? Is there a FAQ?

I don't know how much RAM Geneva/Neodesk would take, so I'd suggest MagiC if you want to go in this direction and can afford it, though add in NVDI (which many newer apps will need irrespective of OS) and you'll be pushed for RAM. You can try out MiNT for free, though I suspect you'll find you use too much RAM.

You need a null-modem cable, not a standard serial cable. Also, try running
the PC-slave program in plain DOS instead of a windows DOS box. I found it
worked better that way on my PC.

Thats the real question, isn't it?

Not sure :) I'm mostly just going to tool around -- I've got a
good PC running Unix at home, and a pile of Unix boxes at work.. which
happensd to be at an ISP. So I've got great connectivity, et al. Mostly,
I'm an old Atari man and wanted to fiddle around with some of the newr
applications that've come out..

I'm interested in screwing around with Mint to see if I can get an
X11 setup going. That would impress the hell out of me. Since theres no
ethernet for the ST, it'd have to run over the serial port, which would be
slow.. but amusing :)

>convenient way, use CAB and a e-mailer I'd say MagiC is your best
choice.

How much RAM does MagiC take up, minimum?

>Geneva is also very good, it's very stable and very compatible with older
>apps. The downside is that you're a bit restricted (GEM only) with these,
>and MagiC is expensive (the updates too).

Seems Geneva is a small footprint, which is good. Neodesk might be
slick, but I've never heard of Thing or the others that've come out
freeland..

>want to run GEM-apps go for MiNT/N.AES. It's very stable and fast, but it
>takes some effort to install and configure if you want to go all the way

Is there documentation? Since I'm a unix guy, Mint shouldn't be
hard to get working. I don't know anythign about it, right now, though..

Is there a port of Emacs for mint?

>with a unix-like setup. It's a lot of fun to hack around though, and it
>performs very well compared to MagiC and Geneva.

Since its free, I guess it shoudl be my first choice, and see how
it goes.

Now, back to the days of disk defragmentation. *sigh* :) (I'm used
to the berkley fast fileysstem in unix, which takes care of all that for
you)

>Yup. I believe SIMMs are easier to find and there used to be adapters, but
>heaven knows where you'd get them these days.

Thankfully I live in one of the biggest cities in Canada; I posted
to a few newsgroups, and someone is going to give me some sipp conversion
kiots, and someone else will sell me SIPPs (1meg, 30pin) for $2.50 each.
I'll pick up a few, and plug them in, and see what happens. 4MB seems to
be useful -- 2mb gets you the OS and toys, but 4mb gets you all of that
and then runs like a 2mb machine :)

>Telnet shouldn't be a problem: choose your TCP/IP stack and client and go.

NVDI? Is it *needed* or just handy?

>> What is COPS?
>COntrol Panel Server - it's a replacement for XControl. Just in case you've
>been off the scene for so long, XControl was the last version of the control
>panel - it uses modules called CPXs.

Ahh; I've got a stack of CPX's for XControl, but I'd prolly never
use them. What I really need is a good shell and emacs, and I'm happy :)
(as long as emacs can run emacs-like). Think I'll have to pop in this
500mb drive I've got, if I can figure out how to open a stacy.

IS formatting and setting up a disk easy? I've forgotten. Been 10
years. Just plug in the drive, boto up the atari hard disk utils, and go
to it? Can that software handle 500MB SCSI disks? How big can partityions
be? Questions-boy :)

>Flame wars have been started over the answer to that one. It does seem to be
>roughly neck and neck between MagiC and MiNT (*dons asbestos suit*). Geneva
>seems to be less popular.

Indeed. MagiC sounds good, but it costs too much for me right
now..

Jeff

Any idea how to join the mint mailing list? I've found archives of
it, but never info on how to join :)

Considering that this dispute was fuelled with 50 posts over the Easter
weekend alone, it's hard to keep up to date.

Mike's last post was today at 11:54 and your was around 12:45. I guess under
your rules, a thread is finished, as long as you had the last word and
nobody replied under 15 minutes.

>Does it include a quarter filled bath..some suspenders and a teaspoon?

Huh?

241. Two NEWSies Now!

Newsgroup: comp.sys.atari.st
Date: 1999-04-06 00:00:00 UTC
From: <>
Message-ID: <370a4c6f.0@news.qnet.com>
Source record: 81301

Well,my ISP (Qnet) went and pulled a fast one on it's users. Starting on Monday, they dropped all the BIN newsgroups from their server, this left me without a way of getting bin.pic.rockets,astro,and gardens. I called them up and now I have to access either SuperNews or NewsGuy to get them,BUT those two nither one get all the other newsgroups, I found at lest one that they don't get.

So I copyed newsie to drive D: and set that copy to access supernews and pull in the 3 bin newsgroups I get.

Oh what fun and games we play with our ISP's.

Nick, I'm with you again. As also Martin-Eric asked, but this guys really
starting to be annoying.

I tried to look into the kill possibilities of Newswatch, but I can't find
any option to kill on a specific "sender", as Popwatch has.

Some time ago, when I still had my point-stuff running, I disconnected
several Nest-areas for the same reason: all this quoting, adding "blah",
or "yeah matey!", yech, I sure hope this NG doesn't go the same way.

For whatever good this Greenwood Guy may have done before, I'm really fed
up with this constant flow of childish behaviour. Seen it several times
before, I think it's been enough.

>Can anyone tell me if there is a program that enables more screen space on
>my ATARI STe 520.

There is a program called MonSTEr that allows you to extend resolutions by scrolling around the normal screen. For example, you can have a 640x400 desktop in 16 colours, but you have to scroll around a 320x200 "window" with the mouse. It can be useful, but headache guaranteed. You should find it on most FTP sites in the "Ste" directory.

Raymond,

The reason Notator looks at the a:\ drive has nothing to do with
copy-protection. It has to do with your font path. It would do that
whether or not you used the dongle.
To find out more (or to keep this from happening at all) take a look at
this:
http://www.mcc.ac.uk/~emagic/SL/FONTTIP.HTM

247. New Website Open!

Newsgroup: comp.sys.atari.st
Date: 1999-04-06 00:00:00 UTC
From: jfhaslam@zetnet.co.uk
Message-ID: <7ednrnhmr2@roch.zetnet.co.uk>
Source record: 81307

Hi All!

This is a message to announce the opening of my own website! It's rather basic at the moment, but that's only because I'm a novice at HTML! ;-))

I used a program called Web Wizard, published by Cadenza Software for the Atari series of computers. It's a great program that enables the putting together of web pages with background images and sound files, and I think they look pretty good! ;-))

At present I have four main sections: My Homepages, My Atari Page, Atari Downloads, and a Links section; but I plan to expand these further with new sections.

The Downloads page only has two files to download, and they are Demos for the Atari Falcon, but I'm open to suggestions on what else to put on there. I only want to put Atari stuff there, and not commercial stuff neither!! :) The demos are: Sonoluminesenz by Avena, and The Lost Blubb by Lazer. These can be hard to track down on the Web, so that's why I've put them on!!

The Links section I think is pretty good, as well as Atari websites there are more general stuff there too, including a section of Online Newspapers that are around (only UK ones at the mo'!).

Whats the address, I hear you cry? Well its:

http://www.users.zetnet.co.uk/jfhaslam/index.htm

Any comments/suggestions on the site are welcome, just email to the address below!

Cheers!

James

I thank you for the offer!

Still, I've found someone who will sell them to me at an excellent
rate... certainly much less than shipping would be ;)

(Some people want $10USD for them (rediculous!), but others want
$2.50CAN for them, which is a nice deal)

JIM

SORRY TO SHOUT BUT THE ZIP WON@T WORK....

well they don't normally, get an old SCSI only ZIP and still expect random oddness, they're hopeless technology, that's why PC owners bought them instead of the massively superior small Syquests....

Hi

I posted a query some time ago about very slow/stop downloads from websites via Zetnet using a Hades, STiK and HSModem. The modem should be capable of 28.8k. Since then I have upgraded to CAB 2.7 which shows the speed of download in bytes per second. Usually this shows about 400 but occasionally does up to 600. What sort of speeds do other setups achieve? I continue to think this is very slow and I am still troubled by everything coming to a full stop after a variable length of time.

I think Knife is one of the better options but it does require some
knowledge of disk structure - there was a tutorial back in the mists of
time.
For mere recovery of deleted files and hard disk management I like Crypton -
programmed by some Swiss guys - it turned up on a Floppyshop disk at one
point but the version I bought was commercial (and IIRC also German) - so
not much help there - sorry!

I don't know what you should expect with a 28.8k modem, but with my 56k I used to see download speeds mostly around 3000 - 5000 on the CAB display. I have recently upgraded to a V90 using the digital lines and see speeds significantly higher than this, 8000 - 12000 is not unusual, although at times there will always be the 400 or so speeds, presumably because the net is busy. Watching mail downloads with Popwatch I frequently see 9000 - 11000 or so, and Newsie's log file confirms this. News collecting in Newsie is slower, around 3000 - 4000.

What sort of speeds do you see downloading mail ?

Like you, I use a Hades, STiK and HSModem. Would you like copies of any of my files ?

By the way, if you use STinG, and use ATW2DT as the Modem prefix in the DIAL.SCR it will report the connection speed in the dialer.

Do you have your Modem 2 port properly connected and configured to as high a speed as possible for your modem, and is the Serial Port CPX flow control set to RTS/CTS ?

Cheers

Paul

> days? I looked in at demon.ip.support.Amiga the other day and postings
> seem to be running at 2-3 per week.

We don't currently have the Amiga version available.

As a cottage industry now (in the non-George Michael sense) operating as a
mail-order business in rural Cambridgeshire, we have staged the relaunch for
financial reasons (the manuals are expensive to get printed and bound
properly) and we remain unconvinced about the sense of offering an updated
Amiga version now.

The PC one goes well (in all senses) and the Atari one's selling OK. We
still do well with the 8-bit Amstrad PCW/CPC versions too, surprisingly.

> >We've also arranged for a Prodata (database) Y2K compliance fix. Protext

I've also ordered the VGA adaptor. Both of my Atari monitors still work, but I thought it would be good insurance to have the adaptor in case they go down. I think VGA monitors will be around for quite awhile (obviously), but it may begin to get hard to find Atari monitor replacements over the next few years as they continue to age.

Also looks like Mario has some other very interesting Atari products as well.

>Oh what fun and games we play with our ISP's.

Dennis, you're damn' right!

I connected to Demon.nl about a year ago, since they were a provider with hi-speed etc. Well, the first 6 months were...

Nowadays they're terrible: I connect to their own servers (NOT going beyond) and transfers are terrible... I can manage to get to 1800 or more bps at times (using a 14K4 modem), but the transfers go intermittent, sometimes 20 secs no bytes coming in/going out at all. They blame it on "connectivity to the KPN network", I translate that into "we took way too many subscribers our servers can handle"... First thing when cable-ISP are allowed here (locally) is kick Demon's ass and switch...

It's costing me a fortune on the phonelines (yeah, dutch KPN is the laughing third party here!)

Well, KPN, Demon: one day cable Internetting will be possible here, that'll be the day you have at least one subscriber less (if not thousands) and I start laughing!

I'm wondering if there might be a plane jane ttp style telnet
client for STi/k/ng? Something that can be run in whatever console/window
you choose rather than depending on the horrid VT100 things I've found
so far.

I.E. I'd love to be able to run telnet.ttp from a ConNect 95/97 window
and have full, proper, vt102 emulation with ansi color at a decent speed.
Or use the simple TOS/WIN for less taxing situtations.

TelStar is very nice...but the emulation just isn't good enough...
Maybe someone knows how to tweek Screen so it will work better with
TelStar?

As for telvt102...it hacks up the screen pretty bad...thoe it's pretty
fast and the emulation is more to standard.

Just and idea,
Brian

Going to add my 2 cents in here...

In my opinion, I think the best OS is the one that does what you
want it to do. There are several different ones to choose from on
the Atari platform and I am glad there are.

If you are heading towards a full Mint setup, I would recommend
starting out with the latest versions of Geneva and NeoDesk.
Both are fast to setup and come with excellent manuals.
Compatibility is excellent and should work fine on a 2 meg Atari.
And will add quite abit of power to your Atari over plain Tos.
I am pretty sure there are demos of both Geneva and NeoDesk that
you can try before you decide to buy. Since Geneva will work
with Mint, You could get into it along the way, If thats the
direction you want to go. I'm not sure that you would have
enough memory to run Geneva and a full Mint setup on a
2 meg system. But you should be able to run a basic Mint
setup with Geneva. There is a version of Mint that either
comes with Geneva or is on the Geneva Utilities disk which
I believe is sold seperate.

Also, you can use a different desktop replacement with Geneva
other than NeoDesk if you want. But there are some benefits if
you use the Geneva/NeoDesk combination.

I really don't know alot about the other OS choices to comment on how they would work on a 2 meg Atari system. There should be some demos for the others ones as well, so you might what to check them out too. And then decide what is best for your needs.

Source record: 81364

Hi all!

Our user group SAK (http://www.sak.nu) have a TT030 equipped with a
Matrix E128 Type 3 graphic card with a 19" black/white-monitor.

Now the driver can not init the card anymore, four bombs at load up.
We can not find the original disks for the card, is there drivers around
somewhere?

The order of these two auto-start files drivers is correct.

We, have the card, so there should not be a problem if someone sends
them to us?

The problem occured when we excluded XBoot to get rid of a password,
a login procedure we no longer needed. A RGB-monitor was also connected
to boot-up with.

Best Regards

Hi!

The Nordic Atari Show will take place here in Gothenburg, Sweden during
11-13 of June. This is the only show in northen Europe this year, so why
not visit us.

Last year we had the Milan at the show, just days before its official release
date, this year we might have a Centek Phenix 060 computer.
Yes, this new monster.

I am working hard to also bring a Milan computer equipped with
MagiC Milan 6.1.

What we know today is that there will be five Hades 040/060 at the show
connected with other computers.

The whole show is based around networking with Atari and compatible
computers. We need folx that can help us to held seminars around this
and maybe show some solutions.

BioNet and SmartNet98 is two things we desperatly need help with.

We also need retailers, to sell hard- and software.

Do not think twice to help us or visit us, just come and see us here,
a nice weekend in Gothenburg is really something.

The homepage is always under construction, I add some constantly.

Hej Mille,

well, not sure about the type E128... I've got stuff for the old Matgraph
series (C32, C110, CoCo, MiCo, MoCo), the TC1006 and TC1208/1208E.
What's gone corrupt? The VDI_XX.SYS file in the Gemsys folder? Or are
INIT.PRG or perhaps AES_MALL.PRG in the autofolder corrupt?
If you're working a 1208 type, you can try the 10061208.ZIP file, which
contains the basic S/W for those cards.

You can check out my homepage, see sig below, just add /matrix/

Otherwise, mail me with more details please.

Hello,

I have a complete Atari Falcon 030 system for sale for 275gbp.
Buyer collects or pays delivery.

4MB RAM, 520MB HardDisk, Epson LQ 100 Printer, SVGA monitor, Graphics
Tablet, loads of commercial and public domain software, books and
magazines. Email me for a complete description.

The most current kernel and filesystem betas can be found there:

http://www.cs.uni-magdeburg.de/~fnaumann/mint/

Official releases are best found on Funet's FTP site:

ftp://ftp.funet.fi/pub/atari

Then, go either to /mint or /piwo-mint sub-directories.

> All the versions of Mint that I can find are 1994 or occasionally
> 1995. Is it still in development, or a dead project?
>
> Are there any good pages to download it? FTP sites?

PS: remember that "beta" means: in-development, might be buggy.
If you try any non-official releaes, it's entirely at your
own risk....

302. Centek news!

Newsgroup: comp.sys.atari.st
Date: 1999-04-06 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <3709d6266a78f0@holleman.demon.nl>
Source record: 81377

Hi!

For those of you not reading "maus.computer.atari.mint-mtos", Centek does have news. Unfortunately they only post to the above-mentioned NG, so I take the liberty of crossposting it.

It looks like the Phenix 060 is gonna make it. Read for yourselves:

PHENIX 060 - Version R1

We enjoy to announce you an updating of our site, particularly important in the domain of the PHENIX, our computer.

Here are the last changes :

1 - the 040 version of the PHENIX is abandoned !
The PHOENIX will be therefore a computer basicly provided with the mythical 68060 at 80MHz, giving 120 MIPS
(040 provides 32 MIPS at 40 MHz!).
Don't be affraid, prices of this 060 have quite changed and we are therefore in measure to propose a 3 or 4 times
more powerful machine for only 2000 FF more in the full configuration.
This tariff could decrease according to providing of 060 because this tariff takes account of the worst offer of our suppliers.

2 - LINUX 060 already exists!
Whereas with one or two 040, LINUX would have been just usable, the 060 offers the necessary strength for a comfortable utilization...
Let's not speak of two 060 (240 MIPS).

3 - the DSP56301 works at 100 MHz and its SRAM descends to 12ns. A light increase of cost for 20 MIPS more(by DSP!).
The addition of a daughter card fitted with 3 DSP at 100 MHz is more that ever of actuality with recent and new objectives of some of our customers and partners.
This daughter card will be connected in the PCI slot #3 but it will be possible to add an identical second of it in the PCI slot #2 (the #1 is occupied by the graphic card).
Total, 7 DSP at 100 MIPS each (700 MIPS) and 3 DSP connectors offering each 4 high bi-directional debit serial channels (either 12) of 33Mbits/s for all numeric application ways...

4 - The utilization of SDRAM instead of EDO is essentially reported to an ulterior version of the PHENIX 060 for cost reasons and time of development. The SDRAM supports are 4 times cheaper than the EDO supports (so 60 FFS more) and besides it's necessary to harmonize SDRAM signals in 3.3 V and signals of the 060 bus in 5V with very speed

buffers (2ns) and costly (60 FF of supplement).
Total, the added 120 FF on the motherboard compensate the gap of tariff between a 32 Mo SIMM and a 32 Mo SDRAM.
For those that know the 060, it is true that he is compatible with signals in 3.3V, but our PCI bridge is not: what obliges us to choose 5 V for all components of the 060 local bus.

Until 40 MHz as regards to performances, the SDRAM doesn't offer ANY advantage on the EDO 60ns: accesses are made on all sides in 1 cycle.
Between 40 and 80 MHz, the SDRAM makes difference because she always permits BURST accesses in 1 cycle whereas the EDO obliges accesses in 2 cycles (that why the SDRAM imposed itself on computers where processsors reach 66, 80 MHz, and more...

On the PHENIX 060, the only way to take profit from the SDRAM is to pass the 060 in ' FULL SPEED' mode on its bus.
It means that instead of accessing the bus to an half frequency of its execution units (in our case 40 and 80 MHz), the 060 would access the bus to the same frequency than its units, so 80 MHz.
The gain is immediate: with EDO 60 nses, we can access at 80 MHz in BURST in 2 cycles, whereas the SDRAM offers 1 cycle.
It means that the 060 bandwith in RAM is 2 times more important !
Unfortunately, our PCI bridge can't be matched with the 060 beyond 45 MHz (verified timing for CENTEK by manufactory), what obliges us 060 accesses at half speed (HALF-SPEED mode) in bridge (toward the PCI bus).
We have a solution to this problem, but it will be for a little bit later, even though the challenge to wire a 060 in full speed on the SDRAM is exciting enough because that has never been achieved!
Imagine that the 060 in FULL-SPEED mode at 80 MHz is able" to swallow " 320 Mo/s with BURST of 1 cycle 80 MHz!
On Phenix R1, we should be sufficient with BURST 1 cycle 40 MHz, so 160 Mo/s... It is already excellent.

The PHENIX should be produced from JUNE 99.

For all question, we recommand you to visit our site before addressing you to our services, because we are already overflowed by numerous questions...

Thank you for your attention.

>decent Atari users into the bargain. I include in this some people

I consider myself peed off by this thread as a whole...

Look, I don't really know who is in the right or wrong, but at the end of the day if you have to get down to a personal slanging match why doesn't everyone involved take it to private email, eh? Both Tony Greenwood and the ST+ team, and Joe Connor and the AC team provide the Atari community with a important service - TBH I'm concerned that as a result of these arguments people from either group, or anyone else on this newsgroup for that matter, will decide to end their association with the Atari community because of the ill-feeling generated. The community is small enough as it is without taking such losses :-(

BTW, just 'cos I'm replying to Mike Kerslake's posting doesn't mean I'm knocking or supporting him - TBH I'm pretty confused about the whole issue - just that the original posting for this thread has disappeared from my newsserver as the thread has been going for so (too) long ;-)

C'mon, everyone take a deep breath and listen to some soothing music (dodgy old goth music always works for me - why not try it!) ;-)

>
> Mutiple near binary size posts listing all the things you think are
> wrong with me..You constantly accusing me of hating AC while I
> constantly say I do not...eeerm yes bordering on abuse I would say.

Tony, as a casual observer to this thread, consider the saying "actions speak louder than words". You may think you are being unfairly accused, but you yourself have attacked AC or related people quite a number of times. One minute you say you publicly support AC (check this thread if in doubt), then you say you have never supported AC, and then start demanding answers accusing other people of opposites.

When you have no substance to argue with the remarks made you accuse everyone of being childish and pretend you're big enough not to reply. It's fine for you to be nasty to others, criticising computers, signatures; and then you think people are being vindictive and claim abuse!!! I am truly stunned!!!

I thought, forgive me if I'm wrong, this was all suppose to be a bit of fun - the Atari scene. Does it really matter? If only we had 'moved on' as Joe suggested when it looked as if this was heading for disaster.

Perhaps we should all join in the discussions on the uk.legal usenet group where you have been expertly seeking legal advice? It makes for very uninteresting reading.

Please stop trying to make mountains out of mole hills. Joe's innocent remarks that seemed to have started this thread, were just that. Considering the difference in votes between the two mags, dead mags were voted for, and that each only received around 50 votes - this hardly constitutes the whole on-line Atari community, considering the number of readers for each mag.

Calm down! Don't take everything as a personal attack! :-)

Best wishes,
Mark.

Hi

It's nice to know that you're having the same weather as we are in SW Wales, so much for the bank holiday! Never mind there's always the other one in a few weeks time and the one after that in a month or so;)

Carefully take the cover off the disk drive and give it a go blow. While you there check that the drive heads are clean; they should look a little on the shiny side (try and catch the light at an angle), if you can see some dull patches then your heads will need cleaning.

I use some old after shave or some cheap perfume, pretty hard to find when you don't have person to go with it;), the important things is that most perfumes are alcohol based so that is evaporates.

Using a cotton wool bud, those things with cotton wall each end of a stick, apply some aftershave etc. to the bud. Don't put to much on it, you don't want it dripping:(

Carefully rub lightly over the bottom head, you should see the bud has now started to get dirty. Use the other end of the bud, the dry end, give the head alight rub.

Check to see if the head is clean and repeat if necessary.

The top head (side 2 of a disk) is a little tricky! I use the DRY end of the bud to give me an idea on if it's clean.

When you are happy the heads are clean, leave the drive for about 10 minutes to allow any wet patches to evaporate.

The perfume or aftershave etc. can cause problems and can DESTROY if dripped on electronic circuits, video/audio tapes and disks. So be very careful.

I use this method on ALL my head cleaning, and have done for many years, and have had NO problems at all.

I cannot accept any responsibility for any damage etc. incurred following these instructions. And therefore perform the procedure at your OWN risk.

->-----------------------------------------------------------------

Naaaah, I suggest dueling computer equipment at 10 paces (or
whatever distance is convenient).

Naturally, some things will be prohibited. For example:

Scanners - Wouldn't want Tony G. using Spice Girl covers,
increasing the number of his offensive players
against AC!

Laser (printers) - Wouldn't want Mike or Joe tattoing "AC Rules"
all over Tony G.'s bod!

Otherwise, mice/joysticks are fine for close in work...CD's for
Ninja throwing stars, and oh! don't forget tray-loading CD-ROMs
for the odd cupholder during tea time...! ;-)))

Have fun, and "May the farce be with you!" (deliberate pun
intended!) ;-))))

PS Cheeky American git, arent' I? <grin>

Would you please take this discussion to email.

This whole thread is a personal dispute in which the only participants
are Tony Greenwood, Joe Connor and occasionally Mike Kerslake. If you
also consider the appalling level of the discussion, and that it is of
NO interest WHATSOEVER to any other Atari user, you'll realize it has
NOTHING to do on c.s.a.s.

From: Adrian Bradshaw <adrian@usanda.co.uk>
Message-ID: <7ed8sg$ji7$1@newnews.global.net.uk>
Source record: 81390

The ST format for floppy disks is ALMOST the same as the PC. It uses only one FAT rather than the PC's two. If you want to be able to copy files between PC and ST, always format the disk on the PC.

The safest bet is to use a DD (720K - not HD1.44MB) disk formatted to 720KB on the PC. A disk formatted like this will read and write in both machines.

Happy copying...

The entire distributions are from that era. You have to install these
(KGMD/KEMD or the TAF) and then update each binary. You'll find everything
at ftp.funet.fi/pub/atari

>find it on the net anywhere. Not that I know how to boot it or anything :)

ISTR from that thread that it was commercial, expensive and discontinued on
the Atari. It's niche seems to be embedded processors and set top boxes.

[TOS versions and hard drives]
> 1.04 in ROM.

That should be OK, I think. It's 1.0 and 1.2 that are dodgy with hard
drives, IIRC.

> 2MB of memory.. max 4mb, people say. SIPPs, which are hard to come
>by anyway :/

Yup. I believe SIMMs are easier to find and there used to be adapters, but
heaven knows where you'd get them these days.

> URL for Teradesk?

Good question. I got it from a PD library initially, though I found the last
version in an obscure FTP archive which is no more. I've managed to locate
what I think is the last version (1.40a) in the Umich mirror at:

http://sunsite.doc.ic.ac.uk/packages/atari/umich/Utilities/Desktop/tdsk140a.
lzh

[net apps]
> I'd like to get telnet going, via PPP or SLIP across the serial
>port. Then I could telnet into a machine here, start up IRC, and use it as
>an IRC terminal. That woudl rock :) Or run a remote emacs..

Telnet shouldn't be a problem: choose your TCP/IP stack and client and go.
The best terminal emulation is with TVT102 which works with STiK or STinG,
therefore no problem in 2 megs. NB it has a few display bugs. Telstar is
more slick and GEM legal, but the terminal emulation is less good. Or there
are at least two IRC (AtarIRC, FracIRC) clients for STiK/STinG anyway.

> NVDI costs, right?

Yup, but some form of GDOS is necessary for many apps and NVDI also
accelerates graphics. Once you've had it you won't want to lose it. There is
a freeware VDI replacement called fVDI, though that's as much as I know
about it.

> And MAgic. Adds up nicely :/

Yes, it is quite pricey.

> What is COPS?

COntrol Panel Server - it's a replacement for XControl. Just in case you've been off the scene for so long, XControl was the last version of the control panel - it uses modules called CPXs.

>>1. Geneva/TOS

> Like oild GEM. Hmm. No desktop with it, though, so its really not
>much use until you do get a Gemini-happy desktop. What is most popular? If

I guess Neodesk is the ideal companion for it, but others work OK, eg Thing. Possibly the last Teradesk as it is multitasking friendly (but no long filenames, though Geneva probably doesn't do them anyway).

> Which OS is most popular? Thats th eone to use, whichever it is..

Flame wars have been started over the answer to that one. It does seem to be roughly neck and neck between MagiC and MiNT (*dons asbestos suit*). Geneva seems to be less popular.

> How well does Geneva handle OS/TTP programs?

No idea, I'm afraid: like I said I've not used it.

[MagiC]
> How much RAM does it just coisume, to hold the OS and Magxdesk?
>(is Magxdesk useful?)

In the region of 700k (MagiC5). Magxdesk is very usable (though early versions were a little crude, I believe). It will also remove itself from RAM if necessary to make more space (though I've never had to use this facility).

> None of the OSes support ppp/slip, right? Its external apps,
>totally?

Basically yes, though you could argue that MiNTnet is at OS level as it is similar to other Unix networking stacks. By far the best solution if you aren't using MiNT is STinG.

> (aside: Whats the most popular development kit these days.. gcc,
>with some gem libraries and resource editors? ie: what was CAB written
>with?)

No idea about programming environments, but CAB up to 1.5 was written in Pascal, I think, and ported to some version of C for version 2 onwards.

>>3. MiNT with replacement AES
> Again.. ramwise.. how much gets consumed by mint, and a 4.1 AESD
>of some sort? I'm an old unix lad, so mint ought not to frighten me, as
>long as there is *some* documentation available.

Hard to say: I seemed to end up with less RAM than my MagiC setup, though as I used to use Thing with AES4.1 it could have been Thing which made the

difference.

> Is mintnet documented anywhere? Any idea (guess?) how much ram
>mint + mintnet + a shell woudl consume? Is 2 enouygh to get mint going,
>some basic networking up and running, and then an app or two?

There are probably docs with it. My hunch would be that simple MiNT/AES4.1 using the built in desktop would probably come in at around the 800k mark, but by the time you've added in MiNTnet, TOSwin, drivers for MinixFS (you'll need a Minix partition if you're going to use the ported Unix apps) etc you probably won't have much change from a meg. The remaining meg would probably be a little tight for most recent apps apart from utilities and text based MiNT stuff.

You could consider CD Writer Plus and ExtendDOS Gold from Anodyne Software. I must admit that on my Hades I have not been able to get this combination to backup my hard-drive but I understand they do work on other Atari machines.

ExtenDOS Gold is said to handle ISO9660 extensions including the Joliet filesystem. (I am simply quoting from the manual. I have no idea what this means.)

>

Hi John,

let me explain a bit: KPN used to be PTT: the Dutch state-controlled phone company/network. We only had one, if you wanted a phone connection you had to deal with them. Hi prices, etc. In the 80-s independant manufacturers brought their own phones onto the market, mostly at half the price PTT calculated (it was only then that you could BUY a phone apparatus, before you could only rent them...) but very soon the State had issued strict requirements for these and they had to be marked "officially approved". Once that was done lotsa people bought their phones independant from PTT. The whole network still was done by PTT. Now some years ago PTT became an independant venture, and at the same time the state allowed foreign companies to enter the market. Good for competition, or better said: break up the price monopoly. First thing they did was setting up mobile phone networks. These had to hook up into the regular KPN network, which still is the only one here. So, as a customer of "cheap phone co" you want to call your girlfriend who still works "old fashioned" with KPN and KPN therefore provides an entry into their own network. At this time we have 5 or more independant mobile phone companies, each setting up their own network (so you see 5 or more antenna-masts in the landscape 10 miles apart into every direction) and they all need "connectivity" into the old

KPN network. That's exactly where KPN screws up: they provide connectivity, but up to a certain amount (their own words: "to the maximum we can provide").
Demon, as an ISP decided to make use of an independant phone company to create "local calls" from about everywhere over here, but the bottleneck appears to be the "connectivity" to the KPN network.

It means, when I'm connecting to my ISP and use the mail/newsservers, so I don't go beyond on congested lines, I get connected and can make full use of my modemspeed and the S/W setup. Up till about 4, 5 months ago. Right now, I connect and discover the average rate lies somewhere at 500-700 bps. This morning I connected at 04:30 local time and it was max speed. If I try now (21:00 local, everyone Internetting around) it might be less than 500 average... Demon says it's the "connectivity". They sued KPN already for that. I got the impression myself that it's an excuse, and figure they have too many subscribers without upgrading their server's capacities.

The problem is that I'm spending 50-75 USD monthly on phone bills. The 15 USD for my ISP is no problem, but has to be added. Right now cable-ISP's are starting, the rates are around 40-50 USD a month and you don't need a phone line for that. Also then I don't give a shit when the average speed comes down to 50 bps, who cares? You pay 40-50 USD a month, whether that is connected 5 mins a day or 24 hrs makes no difference.

>That said, I think the net is getting clogged generally these days, though
>this shouldn't affect connections to local servers such as mail and news.

Exactly: I noticed the congestion going to wherever, never using their own mail- and newsservers. Nowadays it's a nuisance.

But like I said before: the first day cable-ISP is hooked into my local cable-system I switch. Cancel my extra phone line (for data only), kiss Demon goodbye and use the saved money to buy this Phenix-060! :-)

You mean Thing crashes when BetaDOS is installed and INIT=init.prg? I
haven't had any problems here.

> BTW: what is the meaning of cluster.dos and cook_fs.dos? Do I need these
> with my N.AES setup?

Perhaps this is your problem, I've never tried any of these filesystems.
Don't worry, you don't need them. CLUSTER.DOS creates a common drive (like
U on MiNT and MagiC), COOK_FS.DOS is simply a filesystem that allows
reading, writing, creating and deleting cookies through normal GEMDOS
filesystem-calls (Fopen etc).

Yes. Strange enough this doesn't happen all the time. It only happens when
I switch on my Hades after a day rest and use INIT at the first startup.
When I for instance start up my Hades without INIT and then reboot the
system but this time with INIT I don't have that prob.
>

| . . . .
|I don't know what you should expect with a 28.8k modem, but with my 56k I
|used to see download speeds mostly around 3000 - 5000 on the CAB display.
|I have recently upgraded to a V90 using the digital lines and see speeds
|significantly higher than this, 8000 - 12000 is not unusual, although at
|times there will always be the 400 or so speeds, presumably because the
|net is busy. Watching mail downloads with Popwatch I frequently see 9000
|- 11000 or so, and Newsie's log file confirms this. News collecting in
|Newsie is slower, around 3000 - 4000.

Clearly very much faster than my setup.

|What sort of speeds do you see downloading mail ?

I turn off many log-options because of the tendency for NEWSie to
muck up its partition. I just turned the log-transfer-rate on and
news is downloading at 1619 to 2320 cps.

|Like you, I use a Hades, STiK and HSModem. Would you like copies of any
|of my files ?

That would be very kind of you. Are the settings for DRVIN.PRG,
MFP.PRG and SCC.PRG critical?

|By the way, if you use STinG, and use ATW2DT as the Modem prefix in the
|DIAL.SCR it will report the connection speed in the dialer.

I have tried setting up STinG but could not get it to work.

|Do you have your Modem 2 port properly connected and configured to as
|high a speed as possible for your modem, and is the Serial Port CPX flow
|control set to RTS/CTS ?

As far as I know the physical connections are OK. The modem 2 speed
in Serial Port CPX is at 57600 as it is in DIAL.SCR. RTS/CTS is now
set but it wasn't always before.

Yes I know, with my CT2B I can use 640 * 480 65K colors 31,5 Khz 60Hz
(VGA normal) with the videl...

>> >I'm happy that I have got my AB040 after all.
>>
>> Hi Magnus, just a question DSP interrupt works on AB040 ?
>
>I would think so yes.

OK.

> I see no reason why not.

Because BUS of falcon is for 68000, DTACK replace DSACK1 (68030)
and DSP send DSACK0 only to 68030 (not on BUS !). Centek has put
this signal on CT2 but it works only on a normal acces to host port
not in interrupt from host port. This interrupt is used in Quincy
and Aniplayer (with 'direct screen' and 65K colors).

Regards,

Didier.

332. Seagate Hawk and Cubase Audio...

Newsgroup: comp.sys.atari.st
Date: 1999-04-07 00:00:00 UTC
From: Claes Holmerup <claes.holmerup@swipnet.se>
Message-ID: <HbQO2.5014$x43.8163@nntpserver.swip.net>
Source record: 81207

Hi everyone,
A person I know has big problems with a Seagate Hawk Ultra SCSI-2 (ST32155N) disk in CAF.
The disk works perfectly with the Falcon in every other respect, but in CAF, it moves the audio tracks around, so it's impossible to rely on which output (on an FAD8 out) the separate tracks will be sent to.
Another HD works perfectly, so there's no problem with the Falcon or the FAD. Has anyone else experienced the same problem with this model or has anyone such a disk that works?
I know that the older Hawk (not Fast SCSI or Ultra SCSI) usually work fine, but the question is about the Ultra SCSI-2 model.
Any input you can give me is very appreciated.

Don't forget to give me reports about all other HD's you've tried with CAF, so I can make additions to the list on my site - you may help many other Atarians that way :)

Best regards,
Claes

Phantom wrote the following:

>Is anyone using a Toshiba 6.4gig 2.5 IDE Model Number MK6409MAV
>in a Falcon with HD Driver?

I've never tested this particular drive.

>Does this type of IDE drive need to be formatted before using?

>Does the latest version of HD Driver support formatting of
>IDE drives?

You don't actually need to format any HD's. Just partition them in HDDrivers HDDRUTIL program and they'll work. Some old IDE drives can't be used ever again after you've formatted them since the heads/tracks data is located in the boot sector (or at least somewhere on the disk and not in a ROM like in modern HD's), which is overwritten when you format the drive, so I believe Uwe Seimet removed the possibility to format IDE drives since it's not actually needed and to eliminate probable errors.

>I have a 540meg Western Digital 2.5 IDE in my Falcon right now
>and would like to use both drives in the standard case.
>If there is enough room for both of them, is a IDE cable with
>2 female connectors all that is needed to use both?

Be aware! Some 2.5" drives can't be set to Master or Slave, but otherwise there shouldn't be any problems...

>The RPM on the 6.4gig is 4200 is this fast enough to do
>Direct to Disk recording without problems on the Falcon or
>should I stick to SCSI drives for D2D recording?

It depends on which programs you intend to use for HD recording. Cubase Audio can't handle IDE-disks at all for audio tracks, but many other programs can.

>Also when burning Audio or Data CDs with a CDR drive using
>either CD Writer or CD Recorder will IDE drives be fast enough
>to do this on a Falcon or should SCSI drives be used instead?
>Or does it matter?

With a SCSI-drive, you'll probably never be able to write with 4X speed, but only 2X, while it may work fine with an EIDE-drive. I only have a 2X writer, so for me, it's no problem - I can choose whichever HD I want... It would be nice to cut the burning time in half though...

>I have heard that the Falcons SCSI port is faster than the IDE,
>not sure if thats true. Which one gives the best preformance?

That's absolutely wrong!
The SCSI port is limited to a theoretical maximum of 2MB/s (this theoretical speed can actually never be reached) - something that can't be enhanced without changing the SCSI-chip and probably many other things, but in a standard Falcon, a normal EIDE-disk will run at about 2.4-2.5MB/s and if the Falcon is accellerated in some way it will be even faster since the performance of the IDE-bus is depending on CPU and Bus speed. My own Quantum Fireball EIDE's run at almost 3MB/s on my Falcon which has an old, rather slow accellerator, while my Conner Fast SCSI-2 disk runs at 1.8MB/s. In most cases, 2.5" disks are slower than their 3.5" cousins, so I'm not sure you'll reach as high performance as with my two 3.5" EIDE's (yes - you guessed correctly, it's in a tower case... ;))...

If the revision B CT2 doesn't have pass thru connectors can you
add them to the card?

Would it be possible to use 2 ribbon cables connected to the
Falcons internal expansion connectors then connect the CT2 to
theses ribbon cables inside the Falcon and run a length of these
cables outside of the standard falcon case, then connect other
aftermarket cards to theses cable with male connectors?

In theroy I think this should work, I know a similar setup has
been done before with other Falcon upgrade boards.
I wish someone who knows more about the CT2 would check on this.
I need to use the aftermarket cards I have and if I can't use them
with the CT2 revision B. Then there is no need for me to purchase one
unless I get another Falcon.

If I can just jump in here and point out that perfume, after shave,
AND Rubbing Alcohol all have other ingredients that can foul or
otherwise impair your floppy drive heads. Not Recommended.

Use the purest form of isopropyl that you can find - drug stores
usually carry 80%, but will order in 99.9% for you if you can convince
them that you are going to use if for a specific purpose, and that
you're not going to drink it (blindness, even death can result).

Source record: 81216

htm2grp is upated.
What's different?
well, with version 0.1, everytime you ran htm2grp to upate/create the
group, it would ignore the THING settings made on this grp.
As in:
You create a group,. then change the fonts, icons, colors, position of
window, Fine. But then htm2grp again to update your grp. The updated grp
will loose all the extra info (as stated above, fonts, size, colors etc)

With 0.2 this doesn't happen :)
src included. The archive is 14k size big.

343. Atari Computer items - some for price of shipping

Newsgroup: comp.sys.atari.st
Date: 1999-04-07 00:00:00 UTC
From: paul_demarni@bc.sympatico.ca
Message-ID: <%RVO2.12364$LX.4888801@WReNphoon3>
Source record: 81218

I have some miscellaneous Atari Computer Items looking for a new home, the list is as follows:

Atari SC1224 Colour Monitor, c/w captive video cable. Case is damaged, no power cord. Did work but screen had a slight flicker.

Atari SM124 B&W Monitor, c/w captive video cable, no power cord. Worked, but had identical flicker as above monitor (maybe it was the computer?)

Atari Power Supply, was used with 520 computer, unknown condition.

Atari Power Supply, for SF 354 drive, unknown condition.

Atari SF 354 external drive, probably not working.

Cable to connect the above drive to Atari computer.

All the above items can be had for the price of shipping. I am not an Atari user and do not have access to one of these computers to properly test these items. Everything looks okay except for the colour monitor with the cracked case. I weighed the 2 power supplies, disk drive and cable and found that it would cost about $15 CAN ($10 US) to surface ship those to the states. The monitors are heavier yet. Email me if you are interested.

I also have a couple of items that I am selling;

Atari SMM804 Printer. I tested this with my PC. Working, but printing a little light at the bottom of the characters. Maybe a new ribbon would help, or possibly there is a problem with it. I would like $5 plus shipping for this one. For an extra $2 you can have the parallel cable (gold contacts) Item sold AS - IS.

Atari DOS 3 Manual, includes instructions for Atari 810 and 1050 drives. In new condition. This item is listed on Ebay right now, no reserve. Once on Ebay's site, search "Atari Dos" to find it.

I am located in Western Canada, email me for any additional information.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

14meg Atari Falcon030, audio mods done; 2.1 gig Micropolis external SCSI drive (A/V specs); Soundpool FA-8 (eight audio outs) box; Logic Audio Falcon w/LOG3 interface (adds 3 more MIDI outs); external SCSI CD-ROM/Syquest 44 (w/one cartridge) housed in one box; Wizztronics cartridge port expander (from one to four); two mice (one original, one ITSA); joystick; trackball; tons of discs including some Iomega Zips with commercial, freeware, and shareware SW; and serial port A-B switch. Would prefer to sell as package, but will piece out. Shipping is from Milwaukee, WI. I love the Atari platform, but am selling the last of my three systems as I continue to upgrade my new PARIS-equipped recording studio. I have many references on the web, including several Atarians both US and abroad. Please feel free to e-mail with offers and I will respond immediately. Don't forget to include your address and phone number. Thanks! BTW, the highest offer does _not_ necessarily mean anything to me. I want this gear to go to people who appreciate the inherent quality of the Atari system. Don't get me wrong, I want to make $$$ (maybe even $$$$$:) from this deal, but I also don't need to sell to a jerk who won't use it. Socialist panty-waist? Not hardly. Objectivist? Proudly.

>Tony, YHM
>
>Al

Sorry if this all seems petty.. But I can assure you I have issued no threats of violence.. I have not done any swearing or name calling... All I did was ask for an apology...well I sort of demanded one:)

Is this seen as a threat.. it does to me.

Any help appreciated:)

And someone replied to you...

>Anyway, whack along to the police with a copy of it. It sounds like you
>are in fear of physical assault.

Complained to his ISP and am hoping the whole thing goes away now..

Thanks for the input as this whole thing is well out of my knowledge base :)

****

I followed this up with a private email to Tony which he has not acknowledged or replied to.

Now the question is did I threaten Tony? Of course I didn't, I was suggesting that someone who lives in a glass house shouldn't be throwing stones around.

And I have been complained about to my ISP for this? (Of course I'm still waiting to hear from The Data Protection Registrar)

Tony, go look in the mirror and have a long hard look at yourself. Then have a look at the news and try to decide exactly how important you, me and this whole thing is in the grand scheme of things.

Now go away and find someone else to try to bully. You have been shown up as what you are!

Al

>you)

TBH I never had much of a problem with fragmentation on my STE. I think I've defragged the whole disk about twice (in over 5 years), maybe a little more on a couple of heavily used partitions. Probably because most of the partitions are used for programs or fairly static data storage. The big-league constantly-shifting data tends to be mainly on one partition (internet stuff, ie CAB's cache, news, mail etc). Sometimes small partitions and the absence of VM are an advantage, really!

Nope. All the above are free, to the best of my knowledge :-)))))

A couple of useful URLs:

Peter Rottengatter's site (STinG):

http://www.stud.uni-hannover.de/~perot/index-e.html

STiK homepage (clients):

http://www.flinny.demon.co.uk/

Hallvard Tangeraas' Atari URL Launchpad (links to all sorts of useful stuff):

http://launchpad1.atari.org/

> NVDI? Is it *needed* or just handy?

Many would regard it as needed, though unless you use apps that use it it's more in the "handy" category. As the GDOS options have improved over time, more modern apps tend to use them (saves everyone having to do their own font handling and printer drivers: you just have one font handler and system printer). The only real alternative to NVDI is SpeedoGDOS, which lacks the accelerated graphics routines.

If you don't use GDOS programs and can live without the acceleration, you can live without it.

>What I really need is a good shell and emacs, and I'm happy :)
>(as long as emacs can run emacs-like). Think I'll have to pop in this
>500mb drive I've got, if I can figure out how to open a stacy.

You sound like MiNT is likely to be just up your street. I have a vague recollection of there being MiNT emacs ports on the FTP sites, and I think most of the usual Unix shells are available.

>be? Questions-boy :)

Out of my league, really! I confess my HD came preformatted and partitioned and I never tried to alter it, with the exception of replacing the ICD drivers which came with it with HDdriver and turning one partition over to MinixFS for MiNT. HDdriver can certainly handle big drives, though you run into OS limitations before you hit HDD's. There are wiser people around here who can fill you in on the details.

> Any idea how to join the mint mailing list? I've found archives of
>it, but never info on how to join :)

Don't know about joining the list properly, but it is gated to Usenet as muc.lists.mint if you want to take a look. Not sure if you can post to it that way, though.

Well, the scsi-ethernet project is still alive.
I don't know if asante scsi-ethernet adaptors will help us. Asante won't
give technical specifications about their adaptors, so it's almost
impossible to write a driver for it without these specs. Especially
since there isn't a driver on other systems like Linux.
But maybe there is another solution. Check out :

http://gallery.uunet.be/saka/atari/network/projects.htm#SCSI-project

Maybe there are some ppl interested in the adaptors, but I doubt it.

My 1040STe's original Epson SMD380 drive suddenly went after about 5 years of steady use. Eventually I found a used Atari SF314 drive with a more-or-less identical drive in it (an Epson SMD390?) which I transplanted into my 1040 STe. Relatively painless, and tthe 1040 is happy. meanwhile I have these bits of an SF314 with no drive in the bay. Other than that, the experience was relatively painless.

Source record: 81252

Greetings Atari Folks,

Is anyone using a Toshiba 6.4gig 2.5 IDE Model Number MK6409MAV
in a Falcon with HD Driver?

I'd like to know if this drive will work well.
It should arrive here in a few days and I want to be sure
I can use it before installing it.
At the moment I am using HD Driver version 6, but plan to
upgrade soon to the latest version.

Does this type of IDE drive need to be formatted before using?

Does the latest version of HD Driver support formatting of
IDE drives?

Also will version 6 of HD Driver work well enough with this
drive until I get the latest upgrade?

I have a 540meg Western Digital 2.5 IDE in my Falcon right now
and would like to use both drives in the standard case.
If there is enough room for both of them, is a IDE cable with
2 female connectors all that is needed to use both?

The RPM on the 6.4gig is 4200 is this fast enough to do
Direct to Disk recording without problems on the Falcon or
should I stick to SCSI drives for D2D recording?

Also when burning Audio or Data CDs with a CDR drive using
either CD Writer or CD Recorder will IDE drives be fast enough
to do this on a Falcon or should SCSI drives be used instead?
Or does it matter?

I have heard that the Falcons SCSI port is faster than the IDE,
not sure if thats true. Which one gives the best preformance?

Any help is appreciated,
phantomm@eastky.net

Sure, but if you want some decent graphics modes you will need to
add a Nova interface or Eclipse anyway and then you can't close
the the box anyway. If you don't like nice resolutions and speedy
graphics and the possibility to add cheap ethernet cards I guess
it doesn't matter.
.

I have tried contacting Asantï¿½ and several other manufacturers.
All of them mindlessly reply "please upgrade your old Mc 68k to
newer G3 models" first, but when I explain we are _not_ using
Macs, then they reply that anyways the product is discontinued
and they are not interrested in releasing the drivers' sources
to anyone, even if I would agree to signing a non-disclosure
agreement. Basically, they don't give a shit....

>allowed here (locally) is kick Demon's ass and switch...

This stuff about KPN network (is that your phone company?) is rubbish: I get similar dead periods etc from Demon in the UK, particularly with news, sometimes the whole connection. And a look at the Demon groups will show we're not alone, and it's not a platform related problem as it's affecting everyone. It's definitely load-related as everything is much better at unpopular times of day. Do Netherlands subscribers have similar problems with line drops, too?

On the plus side, this kind of thing tends to be cyclical at Demon: everything goes to pot and then they upgrade their systems and all is well for a while until the load increases again. Things tend to be particularly bad after Xmas as all the newbies get started who had modems for presents :-)

That said, I think the net is getting clogged generally these days, though this shouldn't affect connections to local servers such as mail and news.

BTW, one cure for this is to find someone who uses Compuserve for internet access: one look at the snailesque way in which everything barely functions will convince you things ain't so bad after all. Also, an afternoon trying to use the net in the university library where I work will dispell any longings for a permanent connection... :-(

Hi folks!

I'm probably going to sell this &#&%&#" PC and use my TT for CD-recording instead, but before I do this (it's damn expensive!) I wanted to hear from more experienced user how well CD-R software for TOS performs.

I need it mainly for two things:

1) Backing up my harddisks, I really need Joliet-support for this.

2) "Backing up" Playstation-discs (don't ask).

From Soundpools web-site it doesn't look like CD Recorder Pro handles Joliet, this is a serious drawback for such a expensive piece of software. PSX-discs really shouldn't be a problem (even the most basic Windows-copier copies these without problems), but I'd like to hear from people who has actually done it before I spend DEM150 on CD Recorder Pro and DEM700 on a CD-R...

It's here among us....unfortunately it's a German program: DISKUS.

If we want a English version we'll have to ask Dr. Uwe Seimet very
politely.
It's not a language problem this time, cause we know his English is very
good.

This bluntly refusing to release English versions it happening more and
more,
and the reasons the German softwarehouses give just make me ROTFL.... I
know
that there are a lot of Atari users in Germany, but I can't imagine there
are
more of them in one country then in the rest of the world....

They don't produce English versions because they've got the impression
that
there's no market for it... It's up to us to prove them wrong, bombard
them
with eMail, asking & demanding a English version, that's the only way
we've
got to let them now we're out here and are interested in their products.

Cheers from Belgium

Hi Barry! ;-)

On 7 Apr 1999 01:16:02 G, Phantom wrote:
->Greetings Atari Folks,
->
->Is anyone using a Toshiba 6.4gig 2.5 IDE Model Number MK6409MAV
->in a Falcon with HD Driver?

Well, I don't have that particular drive, but I do have the Toshiba
MK2109MAT 2.5"/2 GIG/IDE drive, and it works fine with HDDriver
version 7.61...

->Does this type of IDE drive need to be formatted before using?

NO-do not format IDE drives! You risk damaging them if you do.

->Does the latest version of HD Driver support formatting of
->IDE drives?

I don't think so, but you could ask Uwe Seimet for verification.

<snip-things I couldn't answer>

->Also when burning Audio or Data CDs with a CDR drive using
->either CD Writer or CD Recorder will IDE drives be fast enough
->to do this on a Falcon or should SCSI drives be used instead?
->Or does it matter?

My IDE drive is fast enough. Under SingleTOS, with as few ACC's
and auto folder programs running as possible, I managed 4x to
my Yamaha CDRW4416S, without errors. Note this is with CDWriter,
not CD Recorder...

->I have heard that the Falcons SCSI port is faster than the IDE,
->not sure if thats true. Which one gives the best preformance?

I believe thats right. Interesting note though-if you accelerate
your Falcon, the IDE speeds up. SCSI speed, AFAIK, will always be
the same...

->Any help is appreciated,
->phantomm@eastky.net
->.

Hope this helped some. Catch ya later! ;-)

->
->Jo Even Skarstein

Jo, I have CDWriter + from Anodyne Software (Roger Burrows) who also do
the ExtenDos software. I'm using it with a Yamaha CDW4416S 4 x 4 x 16
speed CDRW. Here are some of my experiences so far...

Joliet support is provided. However, I never even tried to back up my
Minix partition because I could not get it to record correctly while
running under MiNT. I stopped as many active programs (such as CD-Player)
as I could, which is what the author recommends under multitasking setups.
CDWriter ha a "simulated" mode, that does a check on whether or not the
real write will be successful or not. If its successful, the software
goes ahead and does the actual write. At 4x and 2x, it failed under my
MiNT setup. I never tried 1x, seemed pointless...

Now, under SingleTOS, with as few ACC's/Auto folder programs, etc, as
possible running, I got both 2x and 4x recording just fine. Backed up
my 2 Gig HD on 2 CDR's in about 30+ minutes or so...Nice.

I'm not sure why it won't work correctly under MiNT, and until then,
I can't tell if it will back up a Minix partition or not...

Hope this helps some! ;-)

PS Oh, my brother says that you can copy the Playstation disks but
that they won't play without a special chip or something...

Catch ya later...

Sounds like MiNT is what you need. You might even get away with the free
(well, it's been available everywhere for years now so I guess nobody
really cares) AES 4.1-beta if you can live with the (lack of) speed.

Have a look at 'ftp://ftp.funet.fi/pub/atari/piwo-mint/' (and
/atari/mint/) to get an impression of what's available for MiNT.

You should also download the Geneva-demo from Gribnif's web-site (link at
http://atari.nvg.org/launchpad/) and check it out.

> IS formatting and setting up a disk easy? I've forgotten. Been 10
> years. Just plug in the drive, boto up the atari hard disk utils, and go
> to it? Can that software handle 500MB SCSI disks? How big can partityions
> be? Questions-boy :)

You really should buy HD-Driver, it's commercial (but not expensive) but
it's simply the best harddisk-driver available. EOD. Uwe Seimet is also
very supportive, and with the latest version you can have huge harddisks
(more than 8Gb) with huge partitions (does anybody know the limit?) with
support for almost any filesystem imaginable. Old, standard Atari-FAT,
DOS, VFAT, FAT32 (with VFAT), minixfs and ext2fs (still beta, but comes
along nicely) to name a few... (VFAT/FAT32 with MiNT and MagiC, everything
with MiNT)

You don't even need to format the drive, just partition it.

Btw. I believe you need Link '97 to use drives bigger than 1Gb on STs, but
as I don't have SCSI-drives on my STs I really don't know. Uwe Seimet will
most likely correct me :-)

> Indeed. MagiC sounds good, but it costs too much for me right

The initial cost is not too bad, but the updates are IMO too expensive.

> Any idea how to join the mint mailing list? I've found archives of
> it, but never info on how to join :)

Send a mail to mint-request@fishpool.com with the phrase 'subscribe mint'
in the body.

I don't have one, but it will almost certainly work. I can't see any
reason why it shouldn't.

> Does this type of IDE drive need to be formatted before using?

Definitely not.

> Does the latest version of HD Driver support formatting of
> IDE drives?

I don't know, but it doesn't matter anyway because IDE-drives (and
generally SCSI-drives as well) doesn't need formatting. Just partition it.

> Also will version 6 of HD Driver work well enough with this
> drive until I get the latest upgrade?

I really don't know if this version can handle drives this size, but it
worked fine with my 1.2Gb Fireball.

> I have a 540meg Western Digital 2.5 IDE in my Falcon right now
> and would like to use both drives in the standard case.
> If there is enough room for both of them, is a IDE cable with
> 2 female connectors all that is needed to use both?

Yes and yes. Just find a vacant spot and fix the second drive with 3M
double-adhesive tape or similar. The second drive must be jumpered as
slave, consult the datasheet for more info.

> The RPM on the 6.4gig is 4200 is this fast enough to do
> Direct to Disk recording without problems on the Falcon or
> should I stick to SCSI drives for D2D recording?

RPM has nothing to do with it, D2D often needs SCSI because there's no DMA
on the IDE-port. Some programs will work happily with IDE as well, and
your drive is definitely fast enough. Your Falcon is probably a lot slower
than any modern drive, IDE or SCSI.

> Also when burning Audio or Data CDs with a CDR drive using
> either CD Writer or CD Recorder will IDE drives be fast enough
> to do this on a Falcon or should SCSI drives be used instead?
> Or does it matter?

I don't know about CD-Writer, but Soundpool recommends IDE-drives on Falcon because the SCSI-bus is too slow (1.8Mb/s) for 4x writes when it has to read from a SCSI-device as well.

> I have heard that the Falcons SCSI port is faster than the IDE,
> not sure if thats true. Which one gives the best preformance?

Definitely IDE! The SCSI-bus is limited to 1.8Mb/s, while IDE is capable of atleast 50% more on a stock Falcon. Accelerated Falcons can do anything between 4Mb/s (Nemesis) and 8Mb/s (CT2) on IDE, but the SCSI-bus can never go faster than 1.8Mb/s because of the SCSI-controller.

However, with MagiC (and soon MiNT) you can have true DMA-transfers on the SCSI-bus, this will probably result in more smooth multitasking even if the IDE-drive is eight times faster...

Not so great, but it's something I can live with as the TT (unlike my
Falcon) can also run MagiC. I usually tar my minixfs-partitions before
backing them up anyway.

> goes ahead and does the actual write. At 4x and 2x, it failed under my
> MiNT setup. I never tried 1x, seemed pointless...

It's possible that this is related to your problem with ExtenDOS under the
latest MiNT-beta. Have you tried BetaDOS as I suggested? I've been using
it for a few months now and it works extremely well under MiNT and TOS.

> PS Oh, my brother says that you can copy the Playstation disks but
> that they won't play without a special chip or something...

I know, I actually finance my other hobby (radiocontrolled cars) by
installing modchips for spotty brats with CD-R's ;-)

I saw a link on slashdot last year to a 6" LCD-display (and I mean *just*
the display, no casing or anything) with NTSC-circuitry and
RGB-connectors. It was surprisingly cheap, USD99, if it had supported PAL
I'd buy one instantly and build myself a TV-set...

I use a MK2110MAV (2.1 gig) works fine with HDDriver7.x
With HDDriver 6.x i'm not sure. Not tested before.

>Does this type of IDE drive need to be formatted before using?

Normaly not. Create you partitions, that's all.
(Do not create partitions over 1Gig!)

>I have a 540meg Western Digital 2.5 IDE in my Falcon right now
>and would like to use both drives in the standard case.
>If there is enough room for both of them, is a IDE cable with
>2 female connectors all that is needed to use both?

Cable must be short as can! First drive "master" second drive "slave" !
(Watch the four free pins on any 2.5" IDE device)
(These are the master/slave jumpers)

Notebook dealers must have the right cable.

Do not mount the second drive top on the first drive!!
(Heat problems!!)

>The RPM on the 6.4gig is 4200 is this fast enough to do
>Direct to Disk recording without problems on the Falcon or
>should I stick to SCSI drives for D2D recording?

Data transfer must be fast enough, not the spin speed :)

>Also when burning Audio or Data CDs with a CDR drive using
>either CD Writer or CD Recorder will IDE drives be fast enough
>to do this on a Falcon or should SCSI drives be used instead?

Normaly yes. Same as here. Put data from IDE or SCSI devices via
ExtenDOS /CDWriter OR CDRecorder2 to an YM4260. Works allways fine.

>I have heard that the Falcons SCSI port is faster than the IDE,
>not sure if thats true. Which one gives the best preformance?

That's not true. Falcon SCSI ends up to 1800Kb/Sec.
(Physical falcon (DMA) border)

Falcon IDE doasn't use DMA bottelneck. (Ea, what's the right word for..?)

With a CT2 board, as example, you can't got more on SCSI but you
can reach IDE rates of 8MB/Sec.!

My CT2 machine, another example :), boot up from the internal
MK2110MAV (2.1 gig) in neary 30 Sec. (with Cecile) (include MagiC6)
(G3/350 needs nearly 45 Sec!) (Falcon shows the green ready to use
desktop while the mac shows colorised icons on screen..) :->

386. Opening STacy case questions

Newsgroup: comp.sys.atari.st
Date: 1999-04-07 00:00:00 UTC
From: skeezix@loner.icomm.ca
Message-ID: <7eg4tfcj1@hub.org>
Source record: 81285

I was going to try and upgrade the hard disk and RAM on my STacy2.
I've got some SIPPs here, but it turns out they're too tall, and atari
very carefully made it so you can't use anything but super teeny SIPPs.
Benidng won't work :(I was also going to try and pop in a Maxtor 500MB
SCSI drive..

I couldnt' open the case.

I tried from the bottom -- removing 4 or 5 screws form the bottom,
plus a couple from the back. I used a small screwdriver to pry open the
tabs inside ther case, ad was able to lift up one half and the front ands
back of the case.. I coudl lean the whole top half up a few inches. The
back right corner would not budge, though... and I could see no way of
accessing any screws that might be there. (Right near the floppy.. thats
where it was stuck). You can't pry off the empty floppy slot face plate,
and there aren't any screw holes on the bottom or top or in the stacy
monitor area when you open it. It was near the stacy logo plate on the
top.. it was on the back right.

Any ideas?

Any idea where I can get SIPPs? I'm not going to go to BEST for
them.. I simply cannot afford $100CAN plus shipping for 2 MB of RAM.. when
I coudl buy a good 64MB of conventional RAM ofr the same amount :P

Well, it doesn't work for me and probably all the others which have to read
your "contributions".

This thread has been running all over easter weekend and I have a feeling
You just love it.... How much longer do I have to go on downloading your
senseless stupid drivel ?

Do I really have to activate a filter on this newsgroup?

If you really want to make a fool of yourself go visit these newsgroups:

news:alt.comedy.british
news:alt.freaks
news:alt.my.head.bursts
news:alt.pulp
news:alt.stupidity
news:alt.trash
news:alt.duck.quack.quack.quack

Unlike here, you'll be very welcome in those groups.

>>With the risk of getting my head chopped off: Let Tony think he's won,
>>then he quits.
Take this advice, it may be the smartest thing you did since easter weekend.

Cheers from Belgium

Dennis

On my setup BetaDOS (with spin_sd.bos) seems to create a prob. When I use
my KGMD setup the whole system freeze when it try to load Thing 1.27.
If I use my normal MiNT setup (without MiNTnet) BetaDOS works just great

BTW: what is the meaning of cluster.dos and cook_fs.dos? Do I need these
with my N.AES setup?

From: jagger@power.connexus.net.au
Message-ID: <370a40a4.0@news.internex.net.au>
Source record: 81343

I have a 1.5 gig Syjet containing aif files, that I have painstakingly recorded over the past 6 months, for a Film Music CD. The cartrige is damaged, I got 2 partions out of 3 back, leaving one partition I can't access. I took it to a data recovery guy, who was very helpful. But said it would cost $6,000.00 to get the data back. Just out of my price range by about $6,000.00.
Does any one know a good HD editor or Utils that I might be able to use to get some of my songs back? Diskus looks great, but I think it's only in German.
Any advice would be greatly appreciated.

Its called MPEG Fever. Basically its a GEM front end for a handful of
TTP programs which actually do the work. It seems to work OK, as even
a gringo like me has succesfully made an MPEG with it! :)

I'm sure its on any of the bigger ftp sites...

398. Ethernet for all?

Newsgroup: comp.sys.atari.st
Date: 1999-04-08 00:00:00 UTC
From: Jo Even Skarstein <joska@nvg.ntnu.no>
Message-ID: <7eijlk$4kf$1@snipp.uninett.no>
Source record: 81145

I found this incredibly cool gadget on slashdot earlier today:

http://ryeham.ee.ryerson.ca/uClinux/simm/

It's basically a 68k with 4Mb FlashRAM, 8Mb DRAM, ethernetcard,
serial-port and I2C-port on a 30pin SIMM-card! And it runs uClinux!! Just
feed it with power and hook it up to a ST with a serial-cable and you're
off :-)

I can see a couple of really cool things this can be used for. First,
since it runs Linux it's easy to set it up as a router, this means that
you can connect the card to a ST with either a serial- or parallel-cable,
and connect the card to a LAN (or cable-modem) via ethernet.

Second, put the card inside a external modem, add a ST-compatible
parallell-port and run PLIP between the "modem" and ST. The card can then
act as a firewall running IP-masquerading as well as run a mail-server,
and serve a entire LAN (including the ST) with internet-access and mail.
Add a IrDA-port and you can even sync your PalmPilot direcly with the
"modem", you'll never need a desktop-computer again...

I think I've found myself a new toy...

This is going on too far now - I have so far refrained from making any
comments, and although the thread just carries on and on and on, I do
believe in free speech and the right to discuss in a public newsgroup.

However what I am saddened about in this thread is the personal
attacks and threats. :((That is such a shite thing to stoop too...
and I am personally very sad to see people making such comments in a
discussion which need not involve violence.

Heated discussion is one thing, making threats is another and totally
unforgiveable. This is not only directed at Dennis - but to all those
who have mentioned it.

Sad
Very Sad
Totally uncalled for.

Midifiles are midifiles, whatever the platform. Files specifically from
Cubase or Notator/Logic are compatible with their PC counterparts. Just use
720K DOS formatted disks and you're set.

Have a look at the Quick FAQ, maybe...

You're right :)

> Whats the most conveniant OS to run on an ST? I'm not into music,

Well, it isn't MagiC :)
My own opinion is that MagiC is the 2nd worst OS ever, only being
beaten by windoze (slightly).
And before anyone says anything, yes I have used it, and it's a big
pile of cack, in fact I've seen it crash horribly quite a few times, I
set it up as a demonstration on a "test" machine this week.

> Geneva seems not too bad, and reasonably inexpensive. Decent
>package if bundles with Neodesk4... but is that too much RAM consumed on a
>2mb ST? What about the others? Opinions? Comparisons? Is there a FAQ?

Geneva is great, if you want that I can sell you Neodesk 4, latest
version with it's manual for 5ukp inc delivery if in UK :)
Hows that for a plug :)
Ahem, there are FAQ's on Geneva, Neodesk which I know of. Geneva can
be used as the AES for mint if you are interested in heading in the
mint direction, and I have to mention XAAES for the hell of it :)
If you have the HD space, why not grab as much of mint as possible,
you won't be able to take advantage of everything in 2mb ram though.
That's one thing, Geneva & Neodesk don't use much ram, if you wanted
you could run them both from a 1/2mb ST :)

And before anyone shouts at me for just plugging Geneva I do use mint
too :)

AM.

I think therefore I AM.

Thanks Jo, but I think you're exaggerating quite a bit. If I knew so much
about the Atari I wouldn't have ask that question, don't you think so.
Anyway my normal setup is MetaXBS/SPIN.XFS. I'm trying BetaDOS just to
satisfy my curiosity and to see if I could read my N.AES CD without probs.
I still have big difficulties to read that CD-ROM. Most of the times I
only get track01.dat and track02.dat whereas that CD holds I believe 4
dir's.
It can be coincidence but right now I'm using cluster.dos and coof_fs.dos
again and with these drivers it seems that I can read the CD.

The Thing crash and some other probs I initialy had was due to an
experiment with Rational Sound I guess. I forgot to delete some entries in
my n_aes.cnf and this was colliding with BetaDOS.

hello Jeff,
I got a Stacy which has been upgraded to 4 MB (2 --- 4MB) , simply
by soldering wires to normal Simms (costs $ 2 !!) .It works great, no problem !
So don't buy expensive SIPP's, although I know that 'Louis' (look for his
email adress in this newsgroup) has SIPPS for free !! But much cheapier is
my solution.To open up the Stacy you have to dismount the LCD screen, Jeff.
It's tricky, but it can be done.Look out for those white wires, you have to
act carefully, but this is the only way .I changed the diskdrive, which was
damaged by a Mega ST type (1.44 seems very difficult to install, I heard)
and I changed the harddisk for a 80MB one (SCSI) I use my Stacy for
rehearsal with my schoolband. I play midifiles without the melody part and
let my girlchoir (6 young beautiful ladies) sing the blues !!!
I will give you also some letters and answers from Internet.
Here it comes :

REACTIONS -till 24/11/98
Thank you for your E-Mail dated 11-12-98 Jos!

THESE STACY'S ARE VERY RARE IN EUROPE
Stacy in the US are Not very rare. Years latter, we still sell them to
Atari Midi User's! Matter of face we must still have 50 to 100 2 and 4 Meg
Stacys in stock at this time!

I think you are a little confused on this Stacy Battery! All Stacy's have
an internal Battery soldered onto the Motherboard for the Internal Stacy
Clock! You can not see this soldered in Stacy Battery unless you take
apart your Stacy 2!

Now if you are talking about the empty Stacy Battery Pack location behind
the Keyboard, Yes, we have 2 Stacy Battery packs in stock! The Gel
Cell(Lead Acid type) pack, which requires you cut out plastic inside the
Battery compartment to fit the Gel Cell in, cost is U$D75. Then we also
have a Ni Cad Battery pack, which is a drop in, no modifications required
to the Stacy Battery compartment! Cost is U$D 99
The Stacy Owners manual, which has a Standard Atari ST owners manual and a
12 page Stacy Addendum is U$D 12
Cost for the Stacy Addendum with or without the Atari ST manual is the Same
U$D 12.

Regards
Bradley Koda(BEST ELECTRONICS)

The Connection for both of our Stacy Battery packs is located inside the
Stacy! You can see the connector on the Stacy motherboard if you Look thru
the 3 small Rectangular holes located on the left side of the Stacy Battery
compartment! Complete installation instructions come with the Stacy

battery packs we sell!

Regards
Bradley Koda

Am interested, I have just soldered on Mario's IDE/TOS2.06 adapter and am
running a 2 1/2 inch IDE drive in my Stacy4...

http://www.pl.net/~mario/	http://www.pl.net/~mario/tariland/

Martin-Eric Racine The Atari TT030/Stacy Homepage with FAQ
FUNKYWARE CREATIONS OY http://members.tripod.com/~TT030/

I also bought a Stacy2 for 2 weeks ago.I have modified it with 2 handmade
SIPP's and a 50 MB harddisk.I contacted BEST ELECTRONICS.Bradley is
a very kind person which has still an enormous amount of Atari parts.
I saw that in a catalogue of his.In this catalogue there are many hints and
tips about Atari computers and.....the Stacy.
When the plans of an Atari-show in Brussels, Belgium are finalized, he's
probably going to that event, and then I will certainly buy this catalogue.
So I read you're modifying your brothers Stacy.I like to read more of that.
But let's start with my question : WHAT'S THE BEST WAY OF DISMOUNTING A
STACY ???
You used a 2.5 inch drive in the Stacy, why not a 3.5 inch SCSI ??
Have you done something about the powering of the Stacy, I mean a batterypack,
that lasts for more than 15 minutes..... or a poweradapter,
that fits in the empty batterycompartment??
Is it possible to use a 1.44 HD drive ??
What's the best harddiskdriver ? I returned after HDDRIVER, ICD and HUSHI
to plain AHDI !!
I already got more reactions on my message in the newsgroup.
I hope we can help each other with question, hints and tips about this
wonderful Atari model.

Brian Becroft replies:

Ours is a Stacy4, Mario will be making his upgrade board to take the RAM
up to 14MB, it is not made yet, only a matter of time...

We have the Best catalogue, it is very good, the best source around and
valuable with the tips in it. Prices are rather expensive... It cost us
NZD36.

BTW, the early Stacy had the Mega bus port out the side. Later models
didn't, but the holes are still there on the PCB...

> So I read you're modifying your brothers Stacy.I like to read more of that.
> But let's start with my question : WHAT'S THE BEST WAY OF DISMOUNTING A

> STACY ???

Taking the Stacy apart is a bit tedious. You have to get the display apart and the trick is to undo the screws behind the 'Stacy' label. Then the fiddly bit is carefully unclipping the two halves without damaging the plastic. We used a small screwdriver to wedge the case in the right way so the little clipping system holding the two halves together would unclip! There are a few of these around the display, take it slow and carefully.

You can either unplug the display to make further disassembly possible, in this case you need to make a note of where all the wires go. Either way, you need to unscrew a metal strap to give you more room to move with the wires - you have to do what you think is sensible.

The first time we did this was because the screen was very loose at the left hand hinge. There is a powerful spring inside and we found the screws coming loose...

However, upon closer inspection we found cracks in the area where there is re-inforcing struts in the plastic, due to stress from the spring. In this case I put a great deal of plastic around all these areas with a plastic glue-gun. I used up a couple of plastic glue sticks. Very worth while.

Another very bad problem can develop. This is chaffing of the wires from the display where they then go through the shielding which sits over the motherboard. I have put special 'pressure-melting tape around the wires in this area. In fact this is the second time I have disassembled the Stacy and this time I am removing some of the shielding to fit the IDE interface and at the same time remove the shielding which causes the rubbing on the display wires...

Another big problem with the Stacy is that the display backlight goes dim. This has happened to me and so I most often use a seperate display. However, the backlight is an electroluminescent type. It is a thin piece of plastic sheeting which glows when the correct type of power is applied. This is why the PSU board which is mounted over the CPU on the Motherboard has additional circuitry to handle this...

I have checked around for replacements but they seem really expensive.

> You used a 2.5 inch drive in the Stacy, why not a 3.5 inch SCSI ??

The Stacy has the Atari SCSI interface plugged in beside the PSU unit. It is not a very good interface. For instance, a friend put a 2 gig HDD in his Stacy and wondered why he could only see 1 gig. The interface is typical Atari, only half done. There are other problems and you can get around them maybe, depending on the drive. Becxause Mario makes the IDE interface which includes the TOS 2.06 upgrade as well, and because the IDE drives are cheaper in the 3 1/2 inch size and about equivalent in the 2 1/2 size - I thought this would be the better way to go. I left the SCSI 40MB drive in there for now and installed his interface with an old 120MB 2 1/2 IDE drive I had sitting around...

I have not researched the battery issue and have given up on this issue. The standard battery replacements are just not worth it in my opinion because they don't last very long at all. The new Magnesium Hydride batteries may be OK, or some expensive Lithium one. I am sure soemthing could be sorted out, but the Stacy has high power consumption and I wonder how long it would go. However, with the 2 1/2 HDD, the power consumption would be a lot lower, so it depends if you want to research this question.

What I did was to leave the SCSI drive in there, and I have really hacked the Stacy case, it may not have been strictly necessary, but I don't mind it. So what I did was to cut the case where the battery compartment is - I cut the bottom out and also the sides a fair bit. This gives me plenty of room to move for the IDE upgrade and 2 1/2 drive. The upgrade actually sits beside the CPU, which in practice, is beside the PSU board, since this sits over the CPU...

I soldered the upgrade directly onto the CPU. This is slow work. It pays to take your time...

Another thing which is a nuisance with the Stacy is the Trackball. The left and right buttons eventually don't work... Well I unscrewed the Trackball unit and very carefully cut open the micro switch itself and cleaned the insides with Isoproypl Alchohol. It's all very tiny. The micro switches are not made to take apart. I put some of this 'pressure-melting tape' I have around the micro switch top and this has held the 'lid' on the little switches just fine. Now the buttons works fine. I must say, however, that I have become a fan of Mario's Serial Mouse Interface. I use a PC 'Genius Netmouse' This has a rocker button for the middle button. This gives me a double click when I press forwards and a left-click-and-hold when I press backwards. It is the best thing ever made for the Atari computers without a doubt - as regards mice, trackballs and pads. It is definitely a 'must have' item. Actually, I can't wait for him to finally make up the PC keyboard/PC mouse interface (I am using this as I speak) as this combines two good things into one. I do find the Stacy keyboard a nuisance when I use it with Notator - It's the little numeric keypad keys and the arrow keys and the 'F' keys they are not easy to oeprate...

It is a great pity that Atari didn't develop the Stacy... I would love to have a ST book, I have a friend who has one, and it is very small.

> Is it possible to use a 1.44 HD drive ??

Yes if you simply put in a new AJAX chip and I think TOS 2.06, or you can risk double clocking your current AJAX chip - some can take it others can't. For peace of mind, get the suitable AJAX chip.

> What's the best harddiskdriver ? I returned after HDDRIVER, ICD and HUSHI
> to plain AHDI !!

We believe HD driver. We have AHDI, ICD pro, CBHD, To get a HDD that is small these days is hard, to get access to multi gigabyte drives with large partitions, well Mario has tested my 12 gigabyte IDE HDD on his IDE interface with HD driver...

Simple enough: it started as a couple of remarks on your products and
services, but escalated in a series of neverending personal attacks,
between yourself and Tony. At that point, it no longer concerns people
reading this newsgroup; it becomes a private matter, so it should be
persued through private e-mail only.

To clarify: it sometimes _is_ approriate to flame someone, if they have
purposely stated something to generate chaos among the newsgroup users,
or have provided bad service to the Atari community (bad dealers, etc.),
but otherwise, when it become personal attacks, it should be continued
through private e-mail exchanges between the two offenders, only.

A very good posting Dennis. This has cleared up alot of questions
I had on this subject.

Since you seem to know quite abit on this subject I would like read
any info or tips you could pass along on the subject of the Audio
functions of either SoundPools CD Recorder or CD Writer.
One of the areas I'm not clear on is what kHz does samples and
recordings need to be in order to burn them into a Audio CD.

Also, if recordings need to be in a certain format or kHz is there
any good utilities that will convert samples into a format that
CD Recorder or CD Writer can use to make Audio CDs?

Its nice to see informative postings in here instead of tons of
non-related flames and personal attacks. KISS and make up guys. ;)

> #1
> AC won it the year before.. they congratulated themselves.. they stuck
> multiple award signs all over there web pages and they told everyone
> how proud they where to recieve the award...That is documented fact

It must be my memory, but I forget in what way the AC gang went around so proudly...

> #2
> ST+ won the award this year and Joe Conner comes into this newsgroup..
> tells everyone the participation of dead mags is a joke and then
> attacks my ST+ sig that supports ST+ and and places a fx: laugh under
> it..Fact

You want another fact? Let's look at how AC covered the awards from both years:

Issue 8: (1997 awards)
"Best paper based magazine: Atari Computing
Other nominations:
ST Computer/Atari Inside, Dream, ST Magazine"

Yes, I know, it just wreaks of proudness! :-) And before Tony mentions it, ST+ won the best disk magazine that year. And.. Tony won best programmer, which was the at the top of the list printed in that issue of AC, not the bottom...

Issue 12: (1998 awards)

At the top of the page: "Congratulations to ST+ who won pipped Atari Computing for the best paper based magazine by a single vote." They then printed the actual award details in the same was as above, except that ST+ won it.

There was one vote in it. Joe made some innocent remarks. IIRC he laughed at the term "voted by the Atari Community." Well considering both mags only got around 50 votes, this is hardly representative of the readership of both magazines. I also remember hearing rumours of you asking all those involved with ST+ on a mailing list to vote for it... I don't recall AC doing that, but that is besides the point.

Was this deliberately mocking the work of Atari Times, no. If so, why did it take you to raise the sword of blinkered-truth and start a crusade. If you've had so little to do with either mag, why did you take it upon yourself to defend something that was not even being attacked. Surely if real anti comments had been made, those who run either mag would have started the argument?

> He would NOT answer..

IMHO because there was nothing to answer. Anyone with a little reason could have worked out, and smiled at the posting, not announce Jihad until you got your answer. Perhaps we need to send you a Ladybird version of the posting?!

>....then in pops mr rice pudding... we have yet
> to know his motives....

Motives?! You are being unreasonable. You are being arrogant. You are ignoring the real facts and trying to stir things up. My fingers got real itchy when you started saying you were the defender and that you were being bullied. This is utter garbage.

> Show me where I have done anything other than defend myself ? (OK I
> made a few snide remarks while doing so..

An admission? A few?! Dear me, it is a good job you did not make 'a lot of'...

> but how do you compare that
> to the stuff I was having sent my way?)

You got what you deserved. You can't go pointing the finger and expect others to bow down and kiss your feet.

> I gladly admit my part of the blame..

Another admission? What next, [shock] an apology?

> But I did not start the problem

> Because it is the members of AC you are all too frightened to complain
> about there insults.. threats and insinuations....sheep....baaa baaaa

This is utter crap. Do you think AC are the maffia or something? You say you don't attack them, but for you to make such a comment as the one above means you must have some grudge, which we all know you do! :-)

> or is it the thought of one free copy....if so then you are easilly
> bought and paid for:((I refer to the whole group and not just
> yourself)

Tony, nobody was being bought. If you really think that you are madder than I could have thought possible.

> That is
> called hit and run and shows as much backbone as Joe conner did by not
> answering the original question and thus starting this whole
> affair....but hey.. blame me not Joe or you eh :)

Joe did not start anything, only you. Ooohh and let's see if we can stick the knife in further by spelling his surname incorrectly and in lower case!!! And you accuse others of having no backbone. You Tony, are a jellyfish! ;-)

>Go
> stand over there with louis, Jo.V ,Nic and the rest of the AC sheep
> who can only see one side..

You do not understand anything Tony. You can only see one side. Nobody is going to side with AC because they are a reader of the mag. The others you criticise are replying having read both sides.

Best wishes,
Mark.

Your CD too? I have the same problem, it appears to be a problem with
Woller's CD-R. Also, my CD is of very poor quality, it's very rough and
some places you can see small holes in it!

I managed to read the entire CD with NERO on my PC and make a working
copy, if you're interested I can make one for you as well. I don't think
you'll get any help from Woller anyway...

This will probably surprise a few, but... Today I finally managed to get MagiC6 working on my Falcon/Afterburner/Nova, and I have to say that I'm *very* impressed with the speed of the AES! It really flies, or to be more precise, it *feels* like it flies (time some operations and you'll see that it's not faster than N.AES on average). A huge improvement over previous versions. Too bad it still lacks decent networking...

What's weird is that on my TT it doesn't feel any faster than N.AES or Geneva at all, it's just on the 040 it flies.

Anyway, my Falcon is probably cursed, as this version too crashed seriously after about 15 minutes of use. When I rebooted I got the old message telling me that it couldn't find the screendrivers... It's still very solid on my TT.

Actually the uCLinux project is far from stable, but you are right this SIMM-card could be useful here. I have currently been working on porting the Linux IP firewall software to uCLinux (others in the uCLinux group may be porting other software. I know pppd works under uCLinux, and I have it running on the emulator). Also, a friend of mine and I have been thinking of building a similar module that has either two serial ports on it, or a serial and an ethernet port to allow it to be connected to the Atari (or other computers) via the serial port. The other serial port can be connected to an external modem, or if there is an ethernet port, directly to a LAN. Thus, you have yourself a very simple serial to ethernet box. This can be done cheaper since you do not need the 8Mb of Ram (or even 4Mb of Flash) to do simple firewall/PPP operations.

I wanted to build the uCLinux box, since this is exactly what I use my current 486 Linux box for....I have it running pppd and on my LAN at home. The LAN is connected directly to an ISDN router, and the Linux box runs PPP to my Atari TT030 and 4Meg 520st via null modem cables. Thus, I can browse the web via the atari via the linux box via the ISDN router, etc...Having a simple box would be great.

Unfortunately, this little project has been on hold lately and at least months away. If there is considerable interest in such a box, let me know....maybe I can get the ball rolling again.

Later,
Chris /|\

Last I talked to Steve, all Atari development had come to a hault.
They (the corporation) have invested its resources into the PC line.
They still have a supply of Falcon memory cards and IDE adapters and
have supplies of Sound Pool software. I think if it was up to Steve,
they would still be working on the TOS market, but he is no longer in
control.

I've been using Spelling Sentry - used to be commercial, don't know what its status is now - for over a year now, and it works with everything. It's a Control Panel that monitors your spelling all the time and sounds a tone when you enter something questionable. You can then access the control panel to check the proper spelling.

Perfect sense! ;-))

If you have an STFM then you could look out for LaceScan, a hardware mod.
that will allow you to use the black borders as extra working area.

You can't do this mod on an STe unfortunately.

Source record: 81223

Hi guys,

There seem to be a few misconceptions here about what exactly one can do with CD Recorder Pro.

SoundPool CD Recorder Pro supports the CD formats CD ROM, Audio CD, Mixed Mode CD and CD extra. Generic formats, such as HFS, PSX, UNIX and various sampler formats, can be copied with the SCSI copy function.

I'll try to explain what the Generic Format do, because there is a lot of confusion about this:
From SCSI hard disk drives and CD ROM drives in ANY format one can burn a CD. After scanning the SCSI bus, all connected SCSI devices are displayed. The drive which has to be copied is selected and one can burn a straight one to one copy to CD from it. What this means in practice is that one can burn a CD from a partition which is NOT accessable by TOS. Mac HFS, UNIX or some special formats used by samplers can all be transferred to CD. The produced CD can NOT be read by TOS, when copying a MAC HFS partition you end up with a MAC HFS CD. So the Generic Format is OK for backup from ALL none TOS partitions and also to copy CDs like the Playstation PSX format.
There are a couple of drawbacks: the SCSI Copy function only works like its name suggests with SCSI devices, so IDE drives & partitions are not recognised. The maximum capacity is 650MB, so if one has a partition which is bigger, say 800MB, only the first 650MB are copied.

So far so good...
When one wants to create a CD from scratch, this is handled by the the file formatter. The file formatter can NOT handle long file names, these will be truncated and burned like this to the CD. This is a real pain, when working with MagiC or MiNT one starts to use the long file name options rather quickly. The ISO formatter can handle the 9960 level 1 standard, the Atari format, DOS format and a special format which is called: "don't care". With this last option the CD wil be written as the data is. It is not gueranteed however that this CD will work on every OS

Backups
Normally one uses the multi session format to backup data on CD ROM. The program supports the archive bit management function. With the "use archive bit" and "clear archive bit" functions the software will only save edited files to the CD.
So, when one makes a backup from his data, the next time ONLY data that is new or changed will be written to the CD. This saves a lot of space and time.

Burning
Before burning a CD, one can test if the CD will be burned succesfully at

the choosen speed. This is a question of knowing your system....
When burning a CD containing 30000 files (fonts, small gifs, HTML pages) the harddisk can't keep up, and 1X is the maximum speed on a TT. When burning a CD containing big files (>1MB) 4X can be sustained easily...
If you have enough harddisk space the best system is to make an image, this will take some time (15' max.) but then you can always burn at 4X and the time lost making the image is gained back quickly. You also never have to waist time with the "test" option, because an image will always be written succesfully at maximum speed.

Audio files can be written straight to the CD at 4X without the need to make an image, so copying a Music CD goes very fast. With certain writers 4X can not be handled on a Falcon, but on a TT there are no problems.

I'm not gonna explain the Audio CD functions here, for the time just be happy with the fact that it is one of very few programs on any platform which can prepare a CD ready to be pressed by an Recording Studio. Not suprising really, because the roots from SoundPool is the music business after all.

Comparing CD Recorder Pro with CD Writer is unfair...
CD Writer makes backups from partitions which can then be viewed in TOS. So Minix, HFS, UNIX etc are out of the question.
It is capable of making a backup from a accessable partition containing long file names. Accessable partitions is the magic word here...
Compared to CD Recorder Pro, CD Writer Gold is very limited and offers only the pure basics. Considering that CD Recorder Pro has come down in price, the choice should be easy....

CD Recorder Pro works with Falcon and TT, with a Link '97 connected ST & STE can also work with the program. For some strange reason the program does NOT work on a Milan (SCSI card ?), I don't know about the Hades...

Cheers from Belgium

Dennis

NEWsie uses whatever editor you like to edit quotes. Tim simply didn't edit any text. Things are actually pretty controlled here. Consider sites where there is a preponderance of MS products and you get few users who bother to edit and then everything is sent TWICE/TWICE then with HTMLTWICE/HTMLTWICE:-).

An internal editor within NEWsie would be nice.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Why don't you set your shitty system right first? You do know how to set a clock do you?
It's bad enough having to read your drivel, what exactly are you on?

>NEXT? :)
When this thread started I felt some sympathy for your views. Zorro all on his own against the three evil desperado's. I know better now... you're not Zorro but just a nutcase.
I've never seen ST+, but knowing you are involved I don't think I want to anyway. If the editorial contents are like the ones you've been treating us with lately, I'm not suprised it didn't win that "prestigious" award this year, what product could ask for a better Public relations guy... but I gues this also is only a "joke", sad really for the people who put a lot of time and efforts in it to be associated with a nutcase like you.

>NEXT? :)
Not ONE of your postings the last month have been constructive, informative or helpfull in any way. All you do is give off topic remarks, try to make people look silly or give your best shot to start a flame war. What the hell are you doing in this newsgroup?

>NEXT? :)
Today is a sad day.... I never thought that I would have to use a filter on the CSAS newsgroup. It's sad because in a usegroup where everyone has a constructive and helpfull tendency towards each other, one has to use such measures to get rid of someone like you. I suppose this a joke also and you are ROTFL....

>NEXT? :)
You've probably secured you're windows by now, how's your insurance against accidents? one can break a whole lot of bones in funny circumstances.. have you got a car?....better check if it still has wheels -)

Cheers from Belgium

Dennis

I am a bit surprised... IF you are using spin_sd.bos already and MiNT is
running, why then do you use BetaDOS and not MetaXBS/SPIN.XFS?

> find it on the net anywhere. Not that I know how to boot it or anything :)

You could always take a look at the OS9 Home Page : http://www.microware.com
You could email them. :-) You never know, they might be able to help you
out.

> I'd like to get telnet going, via PPP or SLIP across the serial
> port. Then I could telnet into a machine here, start up IRC, and use it as
> an IRC terminal. That woudl rock :) Or run a remote emacs..

You could always install STinG. STinG will give you a TCP/IP stack and
allow you to setup SLIP or PPP over serial cables.

Take a look at the authors home page :

http://www.stud.uni-hannover.de/~perot/index-e.html

There are also several clients available for download from Peter's
page, including a telnet client.

If you want to install a full MiNT setup which will give you a UNIX
like system a good place to start would be with a MiNT distribution
such as KGMD. In my opinion 2MB RAM would leave you with very little
to play with once installed and so 4MB would be better. Also, 20MB
of Hard Disk space may be limitting if you want to install anything
but the basic setup.

A full KGMD setup will give you a UNIX like system with TCP/IP, GCC
setup and multi-user cababilities. It also comes with various clients
such as telnet, ftp and servers such as telnetd, ftpd, nfsd etc.

KGMD is a little old now and so it may be advisable too upgrade
various parts of the distribution including the MiNT kernel.

Have a look at : http://yescrew.atari.org. I'm sure there is a link
to KGMD there.

Regards,

Ben Hills.

> Yes I know, with my CT2B I can use 640 * 480 65K colors 31,5 Khz 60Hz
> (VGA normal) with the videl...

I guess what you want to do with your computer. If you want to look at demos and play most games you will need to use the videl, but as there are so few games and new demos I can't realy say that I have used my Videl for something like 1.5 years now. I don't see the point. And you realy can't compare a shitty slow 40 * 480 65K colors 31,5 Khz 60Hz with 1600x1200 16/32-bit, 65Hz bliztringly fast, or lower res if your monitor can't handle it (mine sure can't). I would guess that 80% of the Falcon users are using GEM apps and in that case they should want something like Eclipse. You can't realy compare a good GFX card with the Videl.

Well, as I have used Aniplayer (looks lovely in 1024x768 16-bit BTW.) with direct screen I guess it works. It was some times since I looked at this though so I might be wrong here. I don't use the DSP in Aniplayer either as it's slower than using the CPU on my computer.

Hello all,
I changed my page a bit today and added the following:
I uploaded a review of using MagiCMac on my iMac which was written for the Phoenix news letter, I wanted to wait till after it was out for awhile before I put it online.
I also took some quick snaps of jinnee 2.01 and Emailer 2, so If you would like to see those they are in the snap section.
I updated the link page, the Tips/Tricks page (Actually just added those Easter Eggs that Halvaard found!)
And above all, Ive added a Credits page, thanking those people who have helped me with my page. Chances are if you think you should be up there, you're probably not. I have to add alot more to it, so its just a quick one right now.

Support for formatting IDE drives was added quite a long time ago. (Note
that the current version of HDDRIVER is 7.7.) Nevertheless you should
think twice before doing this since some drives may be damaged,
especially older drives.

J > - I'm not even aware if there are any rules

Relax, Joe. We don't need no steenking rules!

J > or moderaters

And we don't want moderators. Every so often somebody tries, and
gets flamed right outta here.

Honestly, most people in here are immensely polite. There are
exceptions.... And, of course, many in here (most?) do not speak or
write English as their native tongue. It is difficult to write a
second language and not occasionally seemingly cross the line into
some sort of offense. We understand and compensate.

Now, if we could just get the Americans to speak and write
English... I am embarrassed regularly.

If one can avoid sounding like an arrogant twit, we'll cut him/her
plenty of slack.

Welcome! (belated).

You'll need to go inside the monitor to adjust the picture size. Its not a difficult task for a trained service center, but extremely hazardous for anyone not qualified to work inside a monitor. There are high voltages present inside any monitor --- even when the unit is unplugged! You should not attempt internal servicing unless you're qualified to do so.

Keep in mind, however, that the larger the picture's display, the less sharp it will appear since the displays dpi (dots per inch) will be reduced as the picture size is increased. Of course, on the other hand, it will appear just as sharp if you back away from the screen just a little to compensate for the larger picture area. ;-)

Yup, parallel-port is preferable, then the serial-port can be used for a modem.

> help getting it put into a box (or a support circuit etc, gimme a
> shout.....I can do the hardware if someone can do the software end...

If you want to design a ST-compatible parallel-port I guess I can write a PLIP- driver for it :-) Everything else is taken care of by the uClinux-people. If you only use the serial- and ethernet-ports it's only a matter of configuring it. Once they get it up and running that is...

Anyway talking of buttons, it is very clear that this thread is never,
ever going to end unless you have the last word, so to make these easier
for us all, please feel free to add any comment you wish in the full
knowledge that it will

a) Not be taken seriously by me (or probably anyone else)
b) Nothing you can say is going to have an effect on the "real world"
c) I personally won't be replying to any more of your flame bait. (while
reserving my rights to reply to any message in any thread in any
newsgroup.

470. ATARI COMPUTING Magazine

Newsgroup: comp.sys.atari.st
Date: 1999-04-09 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <370DA821.338B@geocities.com>
Source record: 81049

To the Folks at "Atari Computing" magazine,

Let me be one to welcome you to the Atari ST newsgroup. Things have started a little rocky for you here, but I'm glad to see yall here!

My fondness for the magazine started back in October.

I had been a 8-bit Atarian from 1982-1989, and then left the Atari scene thinking that the ST platform had been a flop (at least that was what some of the 8-bit users that went ST said to me). I bought a Macintosh, and went through college and got my degree.
I emerged from college (and being a missionary in Guam) and a year after that, in October 1998, I find, much to my surprise, an Atari group still in existance!
The club president at the time, David Acklam, showed us publications of groups around the country and the world, and picked up an issue of ATARI COMPUTING with the X-Files cover on it.
My lady, who is not much into Atari computers, became impressed with a computer magazine that would have an X-Files theme. As for myself...
Besides the new-magazine smell, I was impressed at what the Atari community had become. A strange parallel universe and way of doing things different from the PC or Mac.. and yet, it was a fun slant that was just as effective. I found out about Atari clones and programs.
And in the end, I was amazed at how alive platform truly was (and is).
I was impressed that an Atari computer could kick out such a cool magazine. I have ever since used ATARI COMPUTER for ideas on page layout for our club newsletter, AUNT BYTES.

I would love to learn what kind of setup you use to produce the magazine, and more about features and directions for the future editions of AC.

To matter the fact, this thread is for users and AC staff alike to talk about the magazine, for quite frankly, it is my favorite hobby magazine.

(Now if I could just logon to Dark Forces BBS and win that 6 month subscription.. hehe...)

Atarian of old and new,

Doctor Clu
AUNT BYTES newsletter editor

Once you've used a decent graphics speedup program on an Atari, you'll have a
hard time living without it. ;-)

>printer). The only real alternative to NVDI is SpeedoGDOS, which lacks the
>accelerated graphics routines.

Well, fVDI is free and works together with NVDI (in the same way as the NOVA
VDI for example) if you want outline font support and such things.
I've never tried it with SpeedoGDOS, but I'd say the odds are good that it
would work as well.

fVDI can of course handle normal bitmap fonts by itself and I plan to write
a program to convert TrueType fonts to that format soon (using FreeType).
Later on FreeType will be integrated with fVDI, but for now I'm busy
finishing up the Eclipse support and implementing the features that are still
missing compared to the normal VDI/GDOS.

In monochrome mode, fVDI is currently very nice and fast. The sixteen colour
driver does some things in black and white only, though, and the text output
is a lot slower (done character by character via vrt_cpyfm rather than up to
four characters at a time by specialized code as in the monochrome driver
(I'll add the possibility to draw to a monochrome off-screen bitmap and then
do vrt_cpyfm from there RSN(TM), which will increase the speed a lot)).
Needless to say, the hardware accelerated mach64 driver (currently only compiled
for the Eclipse/RageII) is _very_ fast. :-)

fVDI can be found on my WWW/ftp site as mentioned below. The latest real release
version is v0.85, but that is quite old now. The v0.91 beta is a lot better, but
it won't be a real release until I've added mouse pointer drawing to the device
drivers (it's currently left to the old VDI).

Lots of people have fetched fVDI v0.85/0.91beta, but I've only heard from two
or three of them...

If you can't get it to work, please ask me what might be wrong.
If there are problems with specific programs, I want to know about them!
I'd _really_ appreciate some feedback on fVDI!

473. Don't knock the humble ST

Newsgroup: comp.sys.atari.st
Date: 1999-04-09 00:00:00 UTC
From: BobKing <robert.king@patent.gov.uk>
Message-ID: <370DE674.DAF73E25@patent.gov.uk>
Source record: 81052

Some one has recently said that the ST is only fit for use as a hobby. Whether or not that's true, some of the finest programmers gave it truly innovative software, such as CAD 3D. Tom Hudson went on to develop 3D Studio Max, selling for $3,495, the leader in 3D modelling in the PC world. See

http://www.tcp.ca/gsb/reviews/graphics/3dgraphics-q198.htm

for an acknowledgement of its Atari ST heritage.

For the 8-bit Ataris, the Touch Tablet and the Atari Artist cartridge, were years before their time and GEM was there before Windows.

Although I use my Falcon for graphics work and the Internet, I still use my MegaST and SM124 for text work. Protext (not 6.5 - it lost something in the quest for WYSIWYG) and its use of macros, makes converting a typical ASCII 5K help file into a 'Manual' with headers and footers and various attributes for titles, sub titles etc, not to mention stripping out hard returns and replacing long lines of dashes with underlining, a dream - compare with the hassle of WordPerfect.

Bob King

Thank you. Most of the AC team having been reading this newsgroup for a while and they have keep me in touch with anything newsworthy but I thought it was time I took a look for myself.

[FX snip, your background info]

> I would love to learn what kind of setup you use to produce the
>magazine, and more about features and directions for the future editions
>of AC.
We're pleased to report Atari Computing is produced almost entirely using Atari software. The pages are edited in Everest, spell-checked in That's Write and laid out using Papyrus 4 or DA's Layout. Our cover artists have used a variety of software, much of it on other platforms, but we're happy to take what we can get in return for some excellent artwork.

The future for the magazine is harder to predict. We're already planning our Millenium issue and party which we intend to launch/celebrate at the Stafford Atari show this November so we're commited for the rest of this year - around three years after the last UK commercial newstand magazine dissappeared from the shelves.
We have already exceeded all the original goals we set for ourselves when we started the project but there are always new challenges. How long we can keep the
magazine going in its current form depends largely on economic factors. Sadly the Atari marketplace isn't getting any bigger so we're having to work ever-harder to attract advertising and subscribers just to stand still.

> To matter the fact, this thread is for users and AC staff alike to talk
>about the magazine, for quite frankly, it is my favorite hobby magazine.
Thanks very much, that's great to hear. We're also equally pleased to receive constructive criticism so we can broaden our audience.

Hi folks, I have a 520 ST with 4 meg upgrade already. I'm considering getting a T-16 accelerator board for it. The board that I have a lead on has no docs on it.

I was curious if anyone would have the docs for this, or advice, experiences, and so forth?

I have actually two computers I can work with on this.. a 520ST with 1 meg, and a 520 STFM with 4 meg.

Thanks for the advice in advance,

Doctor Clu

Also....

We have a project going on right now to build up the Atari fandom in the United States, Canada, and other parts of our dear land mass. The belief is that there are many Atarians out there going on without a user group when hundreds (maybe thousands) of people still use Atari computers.

So if you are in America and Canada especially, just send your name, E-mail address, and State to:

Greg@atariusers.com

We'll be setting up a webpage soon. Who knows? A user group may be just waiting to be started in YOUR AREA!

Howdy.

I stumbled across an old ST floppy of mine the other day but can't read it with the PC because it was formatted a weird way. All I know about the disk format is that it enabled me to cram 990k onto the floppy. (Great idea at the time - not really future-proof though. Ho hum...)

If any of you clever lot out there know of a way I could get at the data on the floppy using a PC alone (haven't got access to my old 520STFM) I'd be more than chuffed. I'd even buy you a Combustible Edison.

Thanks in advance,
ALAN.

HI
This is Tim!

Sometimes, if the message is importment, I leave it in, so someone reading it
might know what is going on. OR-edit just enough to give an idea of the
subject matter.Sometimes I look at a post, and after reading it, I do not
know the full story or thread of what is going on. Then I have to try to find
the original message to get the information. Sometimes no clue to the
original subject matter is included in the response. Anybody else have this
problem?

>of AC.

No big secret. I do most of the magazine layout (BTW Jon Adams the
layout person is also me!). I use Papyrus 4 running on a 14MB Falcon
and output via NVDI 4.11 to a HP Laserjet 4. Joe Connor does pages 4,
5 and 9 using DA's layout, and again output to a HP Laserjet 4. Most
advert pages are also produced using Ataris, but the very occasional
one is done on a PC, but that's only because they are supplied by the
advertisers that way. Anything I do is 100 per cent Atari produced
because I don't possess a PC or MAC.

As for the future, well who knows. As long as it is financially
viable to continue we will do so, but our future is very definitely
in the hands of our readers, stop reading/buying the mag, and we'll
have to close :-((((

No real idea of what to come in future issues really, but as long as
programmers and Atari users keep things ticking along there will
always be enough to fill the magazine!

>about the magazine, for quite frankly, it is my favorite hobby
>magazine.

Hi !

I've recently tried to send files between the Atari and PC using Z-modem protocol
(and others also) but I haven't had any success.

On Atari I use FreezeDried Terminal and on the PC I use Telix or that Hyperterminal which is included in Win95. I use a normal null-modem-cable and nothing works. When I try to do such simple things as sending one character at a time or a simple text-file I get, in best case, a totally messed up result. Often nothing happends at all. The serial circuits seems to be okay since they are able to send and receive but you'll never know. Yes, I have the same setup on both machines.. Tried all speeds, all sort of setups from 5E1 to 8N1 but nothing works. Nothing...

Has anyone else managed to get any descent contact betwenn Hyperterminal and FreezeDried ?

Thanks !

/Slangen

P > The monitors are heavier yet.

Beware! US Customs puts a hold on monitors shipped to the States
while they check out the FCC certifications for radiation. Can be a
terrible drag (and costs a few bucks, I think) even if the monitor
in question was actually built and certified to US specs (as most
were, I think).

Someone suggested marking monitors shipped to the US as 'Salvage' or
maybe 'Junk'. I haven't tried this.

489. NI (Need Information) GTS-100 external disk drive

Newsgroup: comp.sys.atari.st
Date: 1999-04-09 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <370E56B7.7C8E@geocities.com>
Source record: 81068

Found an external disk drive at a second hand electronics store called
a GTS-100. It's in a black case, and has a digital counter on the front
of it.

Is this a fancy 720K drive, or (hopefully) a high density drive?

If it was a high density drive.. could a 520 ST with Tos 2.06 handle
it?

Thanks,

Doctor Clu

Only way to change this is patching the ROM. TOSPatch by Michael Ruge
does this, among other things.

Ciao

Thomas

From: atari@bright.net
Message-ID: <7elsgi$83k$1@cletus.bright.net>
Source record: 81071

A few changes to the Atari clone page...

I you have a clone and would like to be listed please contact me.

If you already have an clone and need sone help or info that only
another clone owner can help you with then please have a look
at the site. That's what it is for. ;-)

The page covers Milan, Hades and DirecT clones.

Thanks again to those that have decided to be listed and
those that wrote me saying how helpful they found the list to be.

```
: Is there any software to do Fast Fourier Transforms on an Atari
: TT?

I can't point to any off-hand, but I'm sure there are. Can you be more
specific as to your needs, i.e., size of your datasets, type of data
(integer or floating point), format, and so on.

If you are willing and able to compile your own, I can send you a tarball
of some C source for various FFT routines. They should be fairly platform
independent, but may take some tinkering with to get them to compile. I
was able to use them with little trouble under Borland C on a PC <gak>.

>possible! :-))

It's much easier than it seems at first. It suffers in the same way as STinG from being so configurable, but actually the setup files are well commented and in most cases you can take the defaults initially.

There *is* an element of culture shock if you're used to using dialog boxes for everything, but it's worth the investment in time (IMHO, of course). It supports just about everything you could wish for, does mail filtering and sorting, and threads news properly (AFAIK it's still the only Atari newsreader - with the exception of MiNTed unix readers - which threads properly).

Indeed. I'm in the "needed" camp!

>>printer). The only real alternative to NVDI is SpeedoGDOS, which lacks the
>>accelerated graphics routines.
>
>Well, fVDI is free and works together with NVDI (in the same way as the
NOVA
>VDI for example) if you want outline font support and such things.

I don't really understand how these bits interrelate. I thought the NOVA stuff was just special drivers for their graphics cards, NVDI does outline fonts anyway normally and I'd got the idea that fVDI was a freeware alternative to NVDI, rather than working with it. Plainly incorrect. Any chance of an explanation of how all this slots together (preferably at novice level!)?

TIA,
John

This is similar to how they have things in the UK, actually. They use several independents to give 100 per cent local call access, but most people use a BT (former state phone company) phone to connect to that "local" number. Either way, you've gone through the connection between networks before you get to the ISP's servers. From what you say there may well be a bottleneck at that point, but that doesn't explain slow servers at times of heavy load.

>Demon says it's the "connectivity". They sued KPN already
>for that. I got the impression myself that it's an excuse, and figure they

>
>Create two preference files. Name one of them supernews and select load
>preferences when you want to change NGs.

Actually, this isn't a NEWSie problem, it's an ISP/comms problem (apologies for subject drift). I'm getting similar problems to Louis using the same ISP but with different hardware/software (I'm using a PC for net access these days).

One of Demon's strengths is that they carry just about all worldwide newsgroups so there is no great virtue in connecting to another server for different groups as we get them all on the one server anyway (technically it isn't one server, it's a cluster of servers, but it looks like one from the client's viewpoint). Connecting to a remote news server is likely to be even worse as you then get even more congested steps between you and the target server :-(

The good news (for me, anyway!) is that tonight the mail and news servers seemed to be back up to speed (and I was collecting three days' worth at a busy time). Hopefully things are getting beck to normal again!

crosses fingers

Cheers,
John

501. CAB 2.7 & Ebay...

Newsgroup: comp.sys.atari.st
Date: 1999-04-09 00:00:00 UTC
From: Nurmix@NO_SPAM_MEsocal.com
Message-ID: <7elvfk$ji7@enews4.newsguy.com>
Source record: 81080

I'm using CAB 2.7c / OVL 1.3101 / STinG 1.15 under MagiC 5.11 and am having problems with Ebay.

http://www.ebay.com/

I've gone through their registration process, had them e-mail me a confirmation number, and selected a user name and password. After all this, it tells me I am registered.

However, when I try to enter my information (to bid on an item), it continually takes me to a page telling me my user ID or password are wrong. And I know for a fact they are correct as I've triple checked that, and had Ebay e-mail me my information just to make sure it was correct.

So, is there some sort of conflict between CAB and Ebay?
I've got cookies "on" in CAB, and my information is correct, but no go...

Anyone successfully used Ebay with CAB???

I've got some items I'd like to sell but would hate to have to use my roomate's PC to do it. :^(

From: Nurmix@NO_SPAM_MEsocal.com
Message-ID: <7elvg3$ji7@enews4.newsguy.com>
Source record: 81081

Anyone use Pixart 4 (English version)?

The only thing I know about it is what I saw on Homa Systems House' web site, and it looks pretty good.

Basically I need software that will allow me to work with original, scanned, and commercial pics (mostly GIF and JPG) for use on websites. I want something that will allow the use of NVDI/GDOS fonts (or it's own internal fonts?), as well as the usual graphics manipulation stuff.

I've tried a demo of PhotoLine and Apex Media a while back, but those are more than I need. Is there a demo version of Pixart 4 availalbe anywhere?

So, any information on Pixart 4 (or other graphics software - commercial/shareware/freeware) would be appreciated.

Source record: 81191

Joe Connor wrote in message <7egu2nqjs1@plutonium.compulink.co.uk>...
(With apologies for commenting to my own message).

Now that did the trick, my mailbox is filling up nicely!

I'll be at the Neuss Atari Show, in Germany, this weekend so if anyone would like to claim a free evaluation copy in person come along to the Atari Computing stand and ask me. I'll send the rest out in the post sometime next week.
The same deal applies to anyone attending SAMS '99 next weekend in Stafford, England - just ask us for a free evaluation copy.

Thanks to everyone who has expressed an interest so far...

Regards

Joe

Can you not create two separate preference files with the various news servers to access your different NG? This would save you some space.

Create two preference files. Name one of them supernews and select load preferences when you want to change NGs.

Hope this helps.

Later Brian.

516. IRC and Atari

Newsgroup: comp.sys.atari.st
Date: 1999-04-09 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7ek39a$hb86@news.ajou.ac.kr>
Source record: 81193

Have been doing a bit of IRC server jumping for awhile now and notice
that there doesn't seem to be alot of Atari folks using the #Atari
channel in North America. Either that or I haven't found where
everyones hanging out yet. ;)

Even the #Atari channel over in Europe doesn't seem to get much use
either.

Seems to be quite a few folks that post and read the Atari newsgroups,
was wondering why it seems so few use IRC #Atari?

Also, I think there was quite a large following of Atari on Online
services like Genie and etc. Is there much happening with Atari
users on Genie, Compuserve and etc, or are these days long gone?

And is it possible to access services like Genie over the internet
using Atari hardware/software?

517. Falcon Boot with Control Key

Newsgroup: comp.sys.atari.st
Date: 1999-04-09 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7ek420$hb87@news.ajou.ac.kr>
Source record: 81194

Was messing around with the Falcon here the other day and booted up while holding down the control key, Thus bypassing the desk accessories and other programs. Ending up with a clean system in 320 x 200. I have known that you could do this for along time.

But one thing I just found out the other day was that after booting up like above, if you then hold the control key down again, you can also switch into any resolution you want like 640 x 480 and still have a clean system. Which I find very useful at times. Learn something new every day. ;)

Was wondering if there is a way to set the default resolution to something other than 320 x 200 when you first bootup while holding down the control key?

> If it was a high density drive.. could a 520 ST with Tos 2.06 handle
> it?
The GTS-100 was a 720K drive. However, a high density drive (bare) can be bought for less than $20.00 at most electronic stores. I never looked inside mine, but I think it used a standard PC drive unit. If the 520 has (which I doubt) the upgraded driver chip then it should be able to read a high density unit, if one were put in the case. Having TOS 2.06 by itself will not allow the 520/1040/Mega/TT(TOS 3.06) see a high density drive. I'll have to pull mine out of storage and see.

Paul,

Which OVL are you using to connect CAB with the outside world? This could be a communication problem, not an internal problem with CAB. If you don't have it, download Dan Ackerman's latest CAB.OVL (ver 1.3101) and give it a try. If you still have problems - contact Dan and I am sure he will take a look and let you know if it is an OVL problem or a problem within CAB. My experience, so far, with sending passwords is that the problems are more communication interface (ie. CAB.OVL) problems rather than problems with CAB itself.

Hallo !

P>Was wondering if there is a way to set the default resolution to
P>something other than 320 x 200 when you first bootup while holding down
P>the control key?

-Create a newdesk.inf file with the appropriate resolution
-put this one on a partition (or floppy disk) with empty auto folder and no
accessories
-have no accessories on c:\ drive either
-and boot from the drive where the newdesk.inf is by pressing the appropriate
drive letter during bootup

This will work with cbhd, hddriver and hushi hard disk drivers.
The System isn't _totaly_ clean then, as newdesk.inf is being loaded, but very
close to that.

I've got my Falcon in a PC case......From personal experience I'd suggest getting a big old desktop case from the 286 era cos their motherboards were huge and you'll be able to fit the ATari M/B in there or else get a tower and cust some of the 5.25" bays webs to get your M/B in....email me for more details..

Haven't tried it with Hypertermainal, but used Procomm for Windows and
Flash 1.6 and got it to work before, you might need one of the bug
fixes that locks the RTS/CTS Signal so your running a high speed.
Used it to move alot of my Atari data to my PC, sort it out and burn
into a backup CDR of my Atari files. Much safer than contining to
loose my Atari files I've been colecting for about 10 years now.

So, might be a bug fix for RTS/CTS which applies to your version of
TOS. Let us know which version of TOS, etc your using and perhaps
we can help more.

Got one on my System, they were made I believe by GTS which made alot
of better Atari 8 bit and latter ST floppy drives.
It's only a 720K drive, but mine is much quieter writing and reading
from than my old now trashed SF-314 drive.

you're an asshole then aren't you? I cleared out my inbox the other day (netscape, sorry guys) which was taking up 200Mb on my HD (bloatware city), it took my 2.5 hrs and 600 of the messages I deleted were spam

I know you'll never read this, and that's the point ... asshole

It's on a plain TOS-partition (not even VFAT). Yesterday I tried it again
under MagiC6 (it seems to boot every now and then) and I got bus-errors
everytime I tried to start CDRecorder. Perhaps it's just my Falcon, I
haven't tested this version on my TT yet.

542. DIY extra MIDI port for the ST...how to?

Newsgroup: comp.sys.atari.st
Date: 1999-04-10 00:00:00 UTC
From: rew <rew@de-la-mare.freeserve.co.uk>
Message-ID: <7enf2m$tr3$1@news4.svr.pol.co.uk>
Source record: 81115

A few years back there was a DIY project that plugged into the ST's printer port (I think) and gave a second, independent MIDI out.

If anyone's got details of this, I'd like to try it...

thx in advance

> *very* impressed with the speed of the AES! It really flies, or to be more

What's the point in having a fast AES when the %$$%&#$ "OS" writes it's
boot-log to random sectors on my boot-drive? After having tested MagiC6
again today I tried to boot MiNT. Strange, it doesn't work... Booting into
TOS and checks the disk. Looks OK, but when I check mint.cnf I only see a
bunch of boot-messages... Searching the disk for more of these I discover
that the following files has been destroyed by MagiC6:

mint.cnf
n_aes.sys (luckily I use n_aes030.sys)
nova_col.acx
everything in c:\multitos\slb\

Fortunately none of these files has changed since my last backup, it could
have been a lot worse. MagiC6 has now been entirely deleted from my
Falcon, I'm not taking any chances from now on.

What do you need to do to "fine tune" STing? My understanding was
that the packet size, etc. was negotiated with the ISP when the PPP
connection is made. I've tried resetting the packet size once and it
didn't seem to make any difference. Exactly how should I go about setting
STing up for maximum speed?

I've personally had problems all along with every CAB.OVL with passwords and authentication, especially with my University's web site for checking grades and student info. When accessing it, it causes CAB to bring up an authentication "box" (a small separate window asking for input). However, instead of displaying the correct site-specified statement in the box (for this particular site, you are supposed to be given a number, which you must enter after your student ID), CAB displays its own pre-written statement (which I saw in CAB's RSC file). This makes it effectively impossible to access my grades and student information. I don't know if this is a CAB problem or a CAB.OVL problem. I am using OVL 1.3101 and CAB 2.7 demo. Any ideas?

Ok, thanks to this group I was able to download
the snowman demo. I was unable to run it with
either winston or pacifc emulator. This doesn't
surprise me since this was quite a demo for
the st in its time. I can get the video to work
in winston and pacific, but no audio. If anyone
else has been able to get this to work please
post to this group I would greatly appreciate it.
I must say though that I am very happy with the
quality of the winston emulator. Its given me
a chance to relive those 16 bit days of the past
on my current computer.

Hi all!

Just thought I'd let you know that I've updated my new website today. I've put two new files in the download section.

The new files are Demos from the recent Error In Line 1999 party. The first is Alive by FUN. It's a Falcon demo which was second in the Falcon Demos section of the competition. When I ran it the first time, the graphics made me go "Wow!" so I thought it was a good addition to the site.

The second is Breath by Mystic Bytes. This demo was second in the ST Demos competition (the winners of both the Falcon and ST compo's aren't yet available), and as it also runs on the Falcon as well as the ST, and shows good effects, this one is on too.

You can get to the downloads screen directly, by going to:

http://www.users.zetnet.co.uk/jfhaslam/download.htm

Cheers!

Previously...

It's a pity you only want Americans.

Is it that most Americans seem to believe that

World - America = Zero?

Regards, Erhard

@>-->--------------

Wow... did it just get colder in here. Oh, just my apartment's air conditioner kicking in.. good. ;)

Actually your equation is only partially right. In the case of Atari it would be more like....

World - Germany<>Europe = Zero

Atari got a great start in America. In time due to unique circumstances and markets opening and varying prices throughout the world, the Atari ST would find a home in Europe and become a common computer while back in America it would be found that Intel machines would become standard with Macintosh making a distant second in such a brutal market.

I am inspired by how Atari carried on in Poland, Germany, Scotland, Britian, etc. I thought Atari was long gone, and I am pleased to see so many people using such a cool computer.
I am dedicating myself to finding Atarians in America, because that is where I live. I'm asking newsgroups, soon BBS's, and even checking one unique resource.. the E-bay. (And I'm always open to other suggestions.)

Don't know what country you are from, but why don't you move forth to blanket YOUR country with Atari fandom! The world's a big place, and I could certainly use help. :)

Your fellow Atarian,

Doctor Clu

TO ALL...

Got a lot of great response from Americans and Canadians alike. I would love to hear from some in South America at this point.
If you are well versed in spanish, french, or portugese, please send this invite to others in Canada and South America.

And if you are in other parts of the world and would like to see this done for your country, I could always use representatives to talk to to forward addresses to. Like I said, help would be wonderful!

>ideas?

Hmmm... Not really certain how to sort this out right off the top
of my head. If you want to email me the site I can see if I can work
something out. The problem is that with the interface the OVL uses there
is litle that it can do with GEM other than telling CAB what to do.

If I understand you correctly when your site asks for
authentication, it also sends along extra information that you nee to use
with the authentication?

Well, you will notice if you look closely [at the part of my original post you quoted] that I did say I was using OVL 1.3101. ;^) <doh!>

But thanks for the tip just the same!

Anyway, I seem to have gotten it working now. I went through the registration page again (eBay told me I was already registered), I told it to re-send my "confirmation number" (eBay told me it wasn't necessary since I was already registered), so I decided to try [again!] changing my password - I had tried that before several times but it didn't work.

And the one other thing I did differently: When I had logged onto eBay before, I was using my secondary "free" ISP (SLIP connection with STinG). When I did all of this tonight, I was using my normal "pay for use" ISP (PPP connection using STinG).

Anyway, eBay finally allowed me to change the password (even though I simply used the one I was using before), and told me that it was changed and accepted - something which never came up in my previous attempts.

Bottom line is that it appears to be working fine now. I think it might have something to do with the "free" [SLIP] ISP not getting along with eBay since I've had other strange problems with sites in the past using this ISP...

Anyway, thanks!

Hi,

GTS 100 was on of the first 720k drives for the ST. The digital readout is remeniscent of the Indus GT drive for the 8 bit Atari. For any ST model computer to use a HD drive, you must run a line from the 16MHz clock to the floppy controller. This is usually switched via the HD detect switch on the drive. HD drive kits available commercially usually handle this.

John

It is possible to import all archive of messages from NEWSie into OKAMI.
To do this, one needs to copy all NNNNNN.TXT files from NEWSie into
proper directory of OKAMI database and then make import operation, but
(important!) *in UUCP mode*.

I get problems only when the video is set for high resolution with a
lot of colors and is not a VI problem but that the data bus of the falcon
is clogged with the video information and then some odd bug on the DMA
shows up... the solution is not to use that massive resolutions or get
an accelerator like Nemesis or Centurbo.

regards.

Procomm one maybe should try out. Hmm that bug seems interresting.
My Atari is a STE (with Rainbow TOS 1985-1989). Embarrsing is that
I cant nowadays remember what TOS-version that is. For a couple of
years ago I could all versions inside and out, but you forget. Anyway,
I should try with Procomm and with that bugfixer (if its a bug in my
TOS-version i.e).
Can this bugfix be found at the common Atari-ftp-sites or ?

Thanks !!

Glad you got it working! Does your Falcon have a 68882 math co-pro?

I vaguely remember something about MPGFEVER that says the '030 version
is compiled for machines -with- a float math chip...

I could be wrong, but if the 030 version crashes then that could be the
reason (ie...no float math chip)...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Pixart is an excellent painting program... it can use NVDI for fonts
and printing. It's easy to use after a first "how to" stage, and
fairly quick.

>I've tried a demo of PhotoLine and Apex Media a while back, but those are more
>than I need. Is there a demo version of Pixart 4 availalbe anywhere?

Sounds like it's worth a look. ITMT I've returned to NEWSie, simply because
I already have an archive of messages that I'm loath to have split over
several newsreaders. It would be nice to have a "local" newsgroup that could
be accessed by any reader!

Thanks for the feedback.

Have you never heard the saying "people in glass houses shouldn't throw
stones" ???

There's no threat in Mike's paraphrasing of this old saying!!!

Hi John,

as far as Mint is concerned, I gather you want to take the whole bunch.
You may start with the KGMD/KEMD distribution and upgrade that one, or try
the Mint-98 stuff.

KGMD stuff can be taken from ftp.funet.fi/pub/atari/mint/KGMD/

There are several servers with sections on Mint, like the 193.190.205.13
one, and one in Germany with the latest developments, I forgot which one.

Mint-98 is on CD's (AFAIK).

For Linux, you can do the Debian distribution.
Available from several servers, I used
ftp.nluug.nl/pub/os/Linux/distr/Debian/ mainly for speed reasons.

The Linux m68k FAQ at http://www.linux-m68k.org/faq/faq.html (big one!)

The installation guide at http://www.linux-m68k.org/debian-atari.html

592. MEGA ATARI USER LIST APRIL 11, 1999

Newsgroup: comp.sys.atari.st
Date: 1999-04-11 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <37106805.1CA5@geocities.com>
Source record: 81010
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Dear fellow Atarians,

It is with great pleasure that I am able to tell the following.

One week ago I said I would set up a list of Atarians should I receive mail from 20 people giving their name, E-mail address, and state. For the time being I was focusing on America.

I received 30 in the first week!

From this, I already have quite a few states with multiple representatives, some close to each other. This is what I wanted to find out, and in fact, what I knew to be true.

After talking to Kent Kordes in the chat session held at the Atari Users of North Texas website, he said that between 800-1000 different Atari users and gamers buy from him in a year! And that's just of the people who know of him. There must be HUNDREDS more who exist oblivious to the fact that anyone continues to enjoy/use Atari equipment besides themselves.

Make your year and someone else's by sending in your information. The sooner this happens, the sooner we can get some connections going. Let's blanket our fair country with Atari fandom!

Please send the following information to greg@atariusers.com

Name:
E-mail:
State: (City optional)

BTW... I got a method going now which is fairly easy to maintain... so EVERYONE IN THE WORLD SEND IN THIS INFORMATION. I might not get to the information as fast since America is my top priority, but the more addresses I get, the more I can stack those up, the sooner we can find your Atarian neighbor. ;)

Take care and talk soon!

Doctor Clu

PS:

Feel free to update my information as far as clubs go.
If you would like to get your country blanketed with Atari fandom... write me (so I will know who to forward addresses to when I find them)

If they're out there.. we'll find them.. :)

Hi all,

Does anyone who uses Newsie on here ever got the KILLFILE to work
correctly?

I want to be able to transfer different types of E-mails.For
example,all the mail from zetnet-atarians be automatically transfered
to the Zetnet mailbox and all mail from MagiC mailing list transfered
into the MagiC mailbox and so on.

Is this possible for Newsie to do this?

Gordy.

Up to this point I thought I was reading one of those "Get rich quick"
schemes :))

Seriously tho, I wonder how many Atarians there are UK wise?

Would it be worth a UK list?

Hi

Yes, this is the problem.

Over here in the UK it's the same, I'd be surprised if it wasn't;)

There are many, many users that didn't and don't know that the Atari scene is still going and even more don't realise that they can get their Atari's on the internet!!!! Let alone that there are AC and ST+. You can tell in their voice when they realise they are NOT on their own;)

The problem is reaching the masses! How do you let them know!

You shouldn't have to much trouble working with Word Perfect format,
it'll be getting it onto your PC etc...

I presume that you have a 720k disk in your Atari.

Format a disk using Windoze, DOS etc. on the PC side or something like
DC Format v3 (I use this) on the Atari side. Copy your data to the disk
and slap it into the PC.

Hi Tom

What model ST is it?

Some of the early ones had an external PSU. The internal ones (STF,
STFM....) are simple enough to find out.

Yes, the pin assignments are:

1 +5v
2 not connected
3 Ground
4 +12v
5 -12v
6 +5v
7 Ground

There are two +5v lines to provided adequate current carrying capacity
via normal cables.

Are you a member of the former Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990?

Then you should not wait a second longer and surf over to http://www.fortysecond.net/stniccc2000 to discover that, in fact, a reunion of that very historical event is being organised for December 2000, a 10th anniversary reunion as it were! It is going to be the coolest event of the millenium, I can assure you!

>How much should one pay for an Atari STFM with an SM124 monitor and a mouse?

As usual, this depends on the currency in your country and the rarity of ST computer where you live. Here, a 520ST is pretty worthless, a few hundred Francs. A 1040 would be worth around 500 or 1000 francs.

Check out the Quick FAQ.

The Atari uses standard DOS disks, but with an odd bootsector making disks formatted on the earlier STs sometimes unreadable. The later machines (from TOS 1.04) should be ok.

You can format a disk on the PC, and then copy files onto it with the ST. If you don't have an ST available any more, then you can use ST2DOS, a program that makes the Atari boot sector compatible with DOS. You can get it from the Quick FAQ.

Just about any modern WP on the PC or Mac can then read a WordPerfect file.

No, a 520 has to me modified to use a HD drive. Check out the Quick FAQ.

I don't remember any 3rd party HD drives ever being made for the Atari (for
that same reason), so my guess is that it's probably a 720K drive.

An emulator will never be 100% compatible with the real hardware. Especially
when the real hardware itself had it's own compatibility problems
(ST/STE/Falcon).

Get a real ST if you want 100% compatibility.

Nope. No PC will ever read that floppy. Send that disk to a nearby ST user
so that he can copy the files over to a standard DOS floppy.

>I don't really understand how these bits interrelate. I thought the NOVA
>stuff was just special drivers for their graphics cards, NVDI does outline

The Falcon NOVAs (mach64 graphics card) come with a complete VDI, which
NVDI can use as a sort of driver (NVDI will take over the text rendering
(and of course everything to do with printers and such) but will leave
the rest of the output to the NOVA VDI) if you want. It works perfectly
fine without NVDI, though, just as fVDI does.

>fonts anyway normally and I'd got the idea that fVDI was a freeware
>alternative to NVDI, rather than working with it. Plainly incorrect. Any

It's not quite incorrect. It should say:

'...fVDI is a FreeWare alternative to NVDI, as well as working with it.'
;-)

>chance of an explanation of how all this slots together (preferably at
>novice level!)?

Atari's VDI without any extensions can be used perfectly well by itself.
You'll not get any support for printers and such, though, or extra fonts.
For those things you need a GDOS of some kind.

NVDI will add all those things, but will not work by itself on a mach64
graphics card (such as the Falcon NOVA or Eclipse/RageII), costs money
and is not as fast as it could be.

I'm not sure how much, if any, GDOS support there is in the NOVA VDI,
but fVDI has the ability to handle it all by using drivers for the
various devices (well, it currently only loads one device driver).

Writing drivers for all possible devices is a huge job, and not something
I'd ever try doing myself, but there's a nice supporting framework in
fVDI for others to do it (I've sent the sources to a person who was
interested in writing a PostScript driver for example).
Besides the fVDI 'engine', I've concentrated on the drivers I have use
for myself:

- Monochrome
Useful as a 'background driver' for others, as well as the obvious
monochrome graphics mode.
- Four bit planar
The graphics mode I use on my Falcon (or did before I got my Eclipse ;-).
- 16 bit true colour
A very nice mode for graphics cards and usable on the Falcon too.
(The Eclipse/RageII driver uses hardware acceleration for this.)

fVDI is currently a kind of middle ground between the normal VDI and NVDI.
It can use multiple bitmap fonts, for example, and implements some of
the extended features of NVDI.

Apart from printer support, the main edge NVDI currently has over fVDI
is support for outline fonts (TrueType, Speedo, PS Type 1).
TrueType is coming to fVDI (in the form of FreeType, a free (but really
good) TrueType rendering engine) and PS Type 1 might as well, eventually.
Speedo is a proprietary format, however, so that is very unlikely to
ever become available.
So what about people who really must have outline fonts now?

Well, fortunately NVDI was built to be usable together with card specific
VDIs such as the NOVA VDI.
It turns out that the same mechanism allows it to work together with any
VDI, so you can have your outline fonts under fVDI. :-)
In the same way, it's likely that SpeedoGDOS could work together with fVDI.

If you already have NVDI, currently the only reason to use fVDI as well
is if it's faster at some things. On my machine (Falcon+AB40), scrolling
for example can be up to twice as fast with fVDI, so I'd never use only
NVDI now.
Unfortunately, if you use NVDI as your 'top' VDI it will take over all
text rendering and fVDI can be faster at that...

If you don't have NVDI, fVDI will speed up much of your graphics a lot
(it's mostly about the same speed as NVDI or better).
The current version of fVDI, unfortunately, still lacks a few things
that the normal VDI has. I get by well without them, but if they're
important to you, you don't want to use fVDI yet (you're very welcome
to help me implement them ;-).

I'll not tell you what most of those missing features are since I'd
very much like to know what programs actually use them. ;-)
I will tell you that fVDI currently does no text effects, though.
That is, no bold/italic/underline/outline and no angled text.
This does not necessarily mean that you won't get those effects in your
word processor, though. Papyrus, for example, works well since it
renders the fonts itself.

Hi !

>>So, any information on Pixart 4 (or other graphics software -
>>commercial/shareware/freeware) would be appreciated.
>VISION is also good and fast including filter operation for graphics
>retouching, but I don't know about its Font manipulation abilities...
Of course, as I'm the author of VISION I won't say that it's a bad soft.
About font abilities, VISION can setup all attributes (underline, bold...),
rotate the font by 1 degree steps (with NVDI/GDOS) and of course select any
available font.
But the most important thing about VISION is that it is under GEM and FAST !

Have a look at my WEB site !
See you, Jean

623. calamus98 256 color mode problem

Newsgroup: comp.sys.atari.st
Date: 1999-04-11 00:00:00 UTC
From: broncos@primenet.com
Message-ID: <7er0so$nk1$1@nnrp03.primenet.com>
Source record: 81041

Help!
if someone could explain to me why calamus 98 will not show graphics
or fonts (in the font command group display) correctly while running
in 256 or true color, i would appreciate it. It will work in 16 or less
but not hight. There is a program called falcon 8.prg that came in a
auto folder but it causes 2 bombs when auto loading in and then to th
desktop in which i run calamus and still does not work.
please someone help!
gene

624. Printing from G3

Newsgroup: comp.sys.atari.st

Oh-oh! Got my new G3 with USB port and using the new PowerPrint
software but MagiCMac won't see it!!! Any ideas out there? The
configuration screen (holding down <Option> while clicking on MagiCMac
icon) and it says "Not In Use" under the printer button.

> Isn't that an NVRAM setting ? Use an NVRAM editor. Uwe Seimet wrote a very
> nice one as shareware (or freeware, not sure).

You didn't get the point. The question was how to change the resolution
the Falcon TOS uses /in the desktop/ when you do a "safe boot", holding
down the control key just after the harddisk driver was loaded (or when
no newdesk.inf is found).

This is 320x240x16 and hardcoded into TOS, it has nothing to do with the
NVRAM-setting (which does not influence the desktop resolution, anyway).

Ciao

Thomas

This is the infamous Falcon DMA/SCSI bug, appears on almost all
machines, sometimes only when using higher resolutions in >= 256 colors,
but sometimes even in ST-High when stressing the SCSI bus very much -
varies from machine to machine, some people even never experience this
problem, others don't get lockups, but noises when recording music to a
SCSI disk.

There's a hardware modification known as "clockpatch" (various
realizations exist) which fixes this problem in most cases - for my
Falcon, it unfortunately didn't (the simple one).

Ciao

I use both Newsie, which I found easy to set up for myself, and Okami which I could never have set up without help from Martin. However, much as I like Okami, be warned that 1.34 has a millenium bug problem. I tried setting my date to 1st Jan 2000 and then forgot I had done it, so for a few days I left it wrongly set. When I checked all my programmes and files I noticed that the listings in Okami showed all the dates as January 2010. I gather this has been fixed in version 2 beta, but it is no longer possible to register this.

(I am pleased to say that I did not find any other problems at all.)

Cheers

Paul

644. Question: Partitioning PC HD for use on Atari

Newsgroup: comp.sys.atari.st
Date: 1999-04-12 00:00:00 UTC
From: Jeff Brubaker <jtb@email.unc.edu>
Message-ID: <3712A670.86B34BF8@email.unc.edu>
Source record: 80909

I have an external 200 MB SCSI HD that I used to use with my Falcon. Well, a while ago I played around and installed Linux on it. Now I'd like to be able to use it again with TOS. I figured that I'd be able to just select it from within HDX and hit repartition to start playing with it again, but I get a dialog box saying that it couldn't read the first sector and that I should format it first. Odd, I think to myself, but I select format anyway and it tells me that the drive is not supported.

Is there a program out there that can partition this back to Atari-friendly layout? I imagine that ICD's utilities will do it, but I don't have them. I've already hooked the thing up to my PC and used Linux to write a clean DOS-style partition table, the results were the same.

Hi, I am in the UK and I recently got an Atari ST 1040 for very cheap 2nd hand. Unfortunately it didn't come with a mouse, so I'm looking for anyone in the UK who can sell me one (preferably for a low price). I've looked at a few US sites but shipping costs make it very expensive. Or does anyone know any UK-based sites that sell ST accessories?

Please email me direct as my newsgroup server's not always working. Remove NOSPAM from address to reply.

Thanks in advance,

Sam Hawcroft, Hull, UK.

Bengy,

I have considered it, it was one of my first ideas for atari-users.net's file area. But the hosting service I'm using only gives 20 megs of space, and hell it is free too! The trick is to also find a cgi script for downloading files that works with CAB 1.5.

But as you know very well... it's ALOT of work to keep a web site up and running, that is keeping it up-to date.

Hi,

Ich frage fï¿½r einen Bekannten.
Wie bekommt man Calamus 98 dazu auf einem Atari mit mehr
als 16 Farben zu arbeiten, wie lï¿½uft es da mit dem Ausdrucken?

Was ist zu beachten, aus der an mich gerichteten Frage entnehme
ich das es wohl nicht so geht wie es in der Anleitung steht.

Tips?

Danke!
Gruï¿½, Robert

>
> Not sure how to get around it...maybe a complete rewrite!?! :-/
>

A long overdue reply, maybe, but I'm a busy man ;)

When we were working on our slightly bugfixed version of SAM, we discovered what can only be called "The MagiC effect". Basically SAM looks for a TOS version of (IIRC) 2.04 or higher. No problemo we thought.

Then we started getting "bug" reports from people with Mega STes and upgraded STes claiming that it didn't work. Hmm... worked okay on my Mega STe. Then we found out that the problems were all being reported by MagiC users.

So we looked into it a little further and found the following (the exact numbers here are extracted from faded memories of 3 years ago, but the principle is correct):-

On a Mega STe, MagiC reports that TOS 2.0 (or maybe it was 2.01) is installed, so SAM won't run. On a Falcon, it reports 4.0. On a TT ISTR someone mentioning 3.0.

Of course, we were concerned, because programs which should have worked perfectly, but which checked the TOS version, would find that they were being run on a machine with an "old" TOS.

Now I don't know if this was the cause of your particular problems (I doubt it from what you wrote), and I don't know if this still applies to the latest releases of MagiC (though I _wish_ they'd finish implementing the AES4.1 features), but I thought I'd say something in case it clears up any confusing problems for anyone.

Message-ID: <7es11i$j3a$3@roch.zetnet.co.uk>
Source record: 80963

In a former life as an exotic dancer, John Kolak <jkolak@jps.net> wrote:
> The Spectre will not work at all due to differences in the hardware spec
of the Falcon cart port vs the ST cart port. It has nothing to do with the
external floppy port. That served only to allow it to read Mac disks. Spectre
GCR without the floppy connector works as a Spectre 128. Neither will work
on the Falcon cart port.
>

When the falcon first came out, Emagic's (or C-Lab's) Unitor wouldn't work
for exactly the same reason. When they released Logic, the LOG3 dongle did
whatever needed doing to make it compatible. _Possibly_ (no promises) plugging
a Spectre into the through port on a LOG3 would do the trick.

The only trouble is getting a LOG3 - the standard upgrade process is to
destroy the LOG3 if you crossgrade to another platform, so they're getting
rarer and rarer.

If anyone is planning to crossgrade, an extra 100UKP will get your LOG3
returned as well. I spent the extra to have a spare machine and a bit more
flexibility, but given that Logic Atari would probably sell for more than
100UKP, it would be worth buying the LOG3 back to sell on to another Atari
user.

wrote:
> Very good point :-) But the main reason why I want a Palm is that PalmOS
actually is a lot like TOS/GEM, and I'm looking forward to write software
for it. I like it's 68k CP and the free dev-kits, and I intend to write some
GEM-tools for it (like a conduit for aMail).
>

I'm not trying to change your mind, or enter into a debate (as a user of
two "dead" platforms I know all too well that people will use what they want
to, and there's no way you will change their minds), but I just thoug t I'd
point out the following for the sake of completeness:-

The Newton dev kit is available free of charge for d'load from a number of
sites.

It's not at all like TOS/GEM, but is great fun to write for. It uses its
own language (Newtonscript), but it's a fairly easy one to get to grips with.
It's highly object oriented, and the dev kit is very graphical indeed. Imagine
designing an RSC file, but many of your interface elements already know how
to behave without you having to detect them being pressed, then react to them,
etc.

All in all it's a fun alternative to traditional function based programming,
and the unique features of the Newton make it different enough to the "visual"
languages on other machines to still be a refreshing change.

Hehe... you've hit the nail on the head.

You see, we are reaching INTERNET Atarians, and though there are many, I believe it covers (I would guess) one eighth to one tenth the Atari using population.

Let's put our heads together and try to understand both the Atarians off and on the internet.

ATARIANS ON THE INTERNET

1) Most are not on the Internet via an Atari computer. This is true for 8-bit users especially. Most surf and download with a PC or Macintosh.
2) Those that do use internet browsers are slowly growing in numbers, but since this is not a native idea for the Atari, it is rare nonetheless.
3) Atarians on the internet by the above means was counted at roughly 600 in an operating systmem poll, and that was just the people that were aware of it. I would venture to say that the active crowd of Atarians some how involved with the internet would actually number somewhere in.. ??? would I be optismistic to say somewhere near 10,000? (considering 8-bit, 2600, Lynx, Jaguar, and ST.) ST users I think would number in the 2000-3000 range.

(I'm throwing out an estimation.. which invites challenges for other numbers higher or lower. I welcome the input.)

ATARIANS OFF THE INTERNET

1) People who use them for specific applications (word processors, Midi, graphics). To them, the idea of using an Atari for the internet is about as alien as using an etch-a-sketch for faxing.
2) Closet Atarians... those who like them, and keep the machine in storage for one day when they will revisit the old "outdated" computer.
3) The die hard Atarian... they are alone in a world without Atari, long after the others have left.
4) The poor Atarian... they are still using Atari because they can't afford another machine.
5) BBS ranger... still plugging away at the BBS's... since internet is out of reach for an ST and too strange to try.
6) Atarian with phobia... afriad to try the internet.

(Please submit other examples here)

Problem:

The Atari computer was released long for the dawn of the internet era, thus making the means for surfing for Atarians on the internet somehwat null and void. This is perhaps the greatest challenge in finding Atarians today... finding other media in which to locate those isolated souls unaware of an active Atari community, resellers, vendors, and developers.
Till Novmeber 1998, I was one of those people. I stumbled into an Atari user group.

So, here are some means to get the word out that I've come up with so far.

1) e-bay... people buy and sell Atari equipment there all the time from around the world. There you can see vendor and buyer addresses. It is possible that the people buying have a love for the computers, and would love to hear of an existing community. But I'm sure there are many there that buy the equipment for it's nostalgia, being sure that nothing is being done with the equipment.
Auctions of similar nature might prove useful.

2) BBS's... off the internet, still striving in their own right, many members are off the internet entirely. Many call long distance to log on.

3) Old user club listings. Got a club, or had a local club in the area? See if you can find a list of old Atarians. Given them a call, let them know what's going on. The number might be changed, the person might not be interested in Atari at all. But I will say too that with reestablishing contacts I've brought back quite a few Atarians who didn't know anything was still going on!

4) Flyers... at universities, computer stores, and anywhere that will accept a flyer. Also consider placing flyers at sci-fi conventions, computer shows, and shows involving gadgetry.

5) Computer shows... display a Atari computer! That'll shake some of the people up! Hand out flyers

6) Where Atari clothing when walking around for the fun of it. You'll be amazed how many people will stop you to ask you about the Atari and talk about the 2600!

7) Sci-fi conventions.. have to be a great source of computer geeks. Computer geeks run in two categories... ultimate gadgetry or ecclectic gadgetry. Chances are, you will find Atarians in that crowd.

8) Newspaper.. reaches tens of thousands. An add will probably be see by quite a few if you put out an add. If you an get the newspaper to do a story about your club, probably even more so.

9) Comic book stores.... see sci-fi conventions.

10) Radio... get the local public radio station to advertise some special event, such as an Atari show case or computer show being held free for the community.

11) Television (Public Access) Really bold and just brainstorming, but many public access channels allow free time to local interests, and will usally supply equipment for filming. Only problem... usually tends to be a city by city basis.

Those are my ideas for a start.. and let's not forget the best way to bring in Atari users...

12) through contacts of associates and friends. :)

Mac Hine wrote:
>
> I'm thinkin of jumpin ship. G3 looks good. lots of different programs, plug ins etc... 24bit audio. Hmmmmmm.

I'm a Macintosh and Newton user.

Great machines both of them, never really used a PC or Intel machine.
I went from Atari to Macintosh, and now getting back into Atari though Macs are a good alternative.

The way I see it.. Macintoshes are user friendly, hardly ever crash, and are what computers were meant to be in the user market. You might as well stick an antena and VCR on it and make it a household appliance. (And many have).
Make GREAT Atari emulation machines.
But you know, in the nine years I've used Macs, I never really got the same feel for computers, the same fun, as when I used my Atari 400. :)

So I returned back to the Atari realm.

But there is a fun challenge in this age. People think only PC and Mac's exist. But I love how Amiga and Atari continue on dispite all odds. The spirit of computerdom and hacking exist in the Atari realm.

Macintosh... really good to the point that you will forget they are a computer, and will fit nicely next to your toaster.
Atari... a true computer experience!

> <slider@bertste.demon.co.uk> writes
> >I have some files at work that are on a mac, and I need to transfer them to either Atari or Pc.
> >

Plain and simple, TOS rocks when emerging from the Macintosh world.
First off you have the GEM environment that requires NO SYSTEM DISK, and
yet will load an environment that looks just like a Macintosh.
And then, it reads PC/DOS disks. This too rocks!

When I learned that TOS was strange union of Macintosh environment with
a PC disk format.. I loved it!

I use PC formatted disks for all floppy transfers. I mean, why not?
Then both Macs (with PC disk readers.. standand with at least all Macs
with a high density drive and I believe system 7) and PCs can read
them! If the Atari crashes, other platforms can read them.

Which brings up a question of mine... if you formatted a hard drive
with a PC format for similar simplicity.. would the Atari be able to
work with it?

I've been talking to this guy too, but decided it was a bad plan when he admitted that there was no dongle, manuals, box or anything else to verify that he was selling legal software.

Guess $40 for Cubase 3.01 was too good to be true.......

Rory (another Rory)

I would not recommend using BigDOS for this, as it's still a bit unreliable
(esp. on Falcons). Try MiNT 1.15 instead, it supports DOS-compatible FAT16-
and FAT32-partitions, with and without VFAT. Later versions of MagiC also
supports these (FAT32 from 6.1, IIRC), but I guess it's overkill to spend $$$
on MagiC if all you need is a way of transfering files to/from DOS-disks...

> Worth turning off MagiC's logging option in magx.inf?

Sorry, but since MagiC most likely use it's own filesystem to write the log (doing otherwise would be just plain stupid) I don't trust it for *any* disk-access anymore. I will never again make the mistake of booting it on my Falcon, especially since everytime I've stopped using MagiC (and promised myself not to use it again...) it's been because...

a) ...of it's incredibly poor stability.
b) ...it regularely kills my C-partition.

However - as I've said many times before - on my TT I don't have any problems with it.

680. /i\ RARE Supervision Handheld W/27 games for Trade for Falcon

Newsgroup: comp.sys.atari.st
Date: 1999-04-12 00:00:00 UTC
From: katom96@aol.com
Message-ID: <19990412085915.04144.00003549@ng-fi1.aol.com>
Source record: 80985

I will tade for a Atari Falcon Computer

Here is what you get The Supervision Handheld System in the box like new. Boxed TV Link its in Pal (dont know if it works on America TVs) and 27 games This is very RARE to find especially with all the games I have plus some are still sealed WOW. A must for Collectors. Only serious offer pleaseThanks

For those who dont know what the Supervision is , its a handheld game thats similar to the GameBoy The screen is bigger and the carts look about the same its a lot cooler looking to it also bends in the middle so you can angle the screen and it has legs that flip out so you can set it on the table and play it. It was released in 1992 and disappeared fast Its very RARE and hard to Find.

The games are:
2-in -1 Game (box)
Ssnake (box)
Chimera (box)
Pyramid (box)
Honey Bee (box)
Bubble World (box)
Pacific Battle (box)
Kitchen War (box)
Hero Hawk (box)
Treasure (box)
Grad Prix (Box)
Kabi Island (sealed)
Changeller Tank (sealed)
Egale Plan (sealed)
Dream World (sealed)
Ballon Fight (sealed)
P52 Sea Battle (sealed)
Popo Team (sealed)
Matta Blatta (sealed)
Penguin Hideout (loose)
Olymic Trail (loose)
Jaguar Bomber (Loose)
Alien (loose)
Police Bust (loose)
Scaffolder (loose)
Super Kong (loose)

E-mail offers to
katom96@aol.com

Thanks Tom

6.061, ask any archie for an appropriate ftp site.

Oh, and BTW it is a waste of time to get AHDI. I'd advise you to
cantact Uwe Seimet and get a recent version of his HDDRIVER. That
software will be compatible with new hd and exchangeable media drives
(PD, MO, JAZ, ZIP, etc., AFAIK even DVD-RAM).

683. FS/T: Atari ST games [04/12/1999]

Newsgroup: comp.sys.atari.st
Date: 1999-04-12 00:00:00 UTC
From: VideoGameAdvantage@DittosRush.com
Message-ID: <371b0703.661172@news.nls.net>
Source record: 80988

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 04/05/1999

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection is currently on-line! Unfortunately, there is no
list for this system (cartridge and CD based systems only).

I have the following Atari ST software for sale or trade.

Unless specified, all items are *NEW* and are still shrinkwrapped.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped! Includes box and manual]:
$ 4.00 Art & Film Director (Epyx) -- $4.30 shipping, due to
weight, counts as 1st item
$ 3.00 California Games (Epyx)
$ 3.00 Death Sword (Epyx)
$ 2.00 Devon Aire (Epyx)
$ 2.00 Dragon Scape (Free Spirit)
$ 2.00 Final Assault (Epyx)
$ 3.00 GFL Football (Gamestar)
$ 2.00 Lands of Havoc (Antic Software)
$ 2.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 3.00 Metro Cross (U.S. Gold / Epyx)
$ 3.00 Paint Pro (Abacus Software)
$ 2.00 Prime Time (First Row)
$ 3.00 Quadralien (Spinnaker)

$ 3.00 Renegade (Taito)
$ 3.00 Stunt Track Racer (Microplay)
$ 2.00 SwiftaR (Accustar)
$ 3.00 Techno Cop (U.S. Gold / Epyx)
$ 4.00 Warship (Strategic Simulations, Inc.)
$ 3.00 Winter Games (Epyx)
$ 3.00 World Games (Epyx)
$ 3.00 World Karate Championship (Epyx)

SPECIAL: Buy one (1) of each listed title and receive 10% off.

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.20 for the first game and $1.10 for each additional game. Shipping for hardware and accessories depends on the distance that the order must travel. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

Hi Jo Even,

this puzzles me... everytime I read/hear about one experiencing trouble
with MagiC, it appears to be on a Falcon.

I've seen more reports like "...but on the TT; no problemo"

My own experience on my TT: after a few years, experimenting and
finetuning: rocksolid. Simple as that. OK, that's version 5.01...

One minor change in autofolder sequence and you're in trouble again.

I wonder how much the Falcon itself contributes to the fact that some
people hate Magic???

And I've Calamus SL 98 running in TC under MiNT on my Hades 060 without
any problem. I must use 'novacal.prg' in my autofolder however in order to
run Calamus with more then 256 colors. Novacal.prg is a small prg that
comes with the NovaVDI graphic card drivers.

AFAIK, Calamus 1.09 only works in monochrome.

Sadly but true. The firm who make the CD's for Delta Lab's went bankrupt
what made that Delta Lab's which had paid already for the next magazine
and so lost quite some money hadn't enough money to start all over again.

If I remember correct, there is a program called 'Zorg' which is some kind
of 'rewrite' from 'disk doctor'. You can find the program on most Atari
FTP-sites.

Source record: 80861

Hi,
I just wanted to let everyone know that ScanX is now also
compatible with the UMAX Astra 600s series of scanners,
including 600s and 610s. These scanners are very inexpensive
and offer good quality color/monochrome/grayscale scanning.

For more info, please Homa Systems House at:
homa@canada.com

or visit their webpage at:
http://www.magma.ca/~nima

Best regards,
Nima Montaser

P.S. ScanX has traditionally been compatible with UMAX 1200s
series (1200s & 1220s) as well as all new Microtek Scanners.

[Okami]
>Understood. Now, can anyone tell me how to get the TTP utilities run in a
>VT52 window when run from within Okami under MagiC - or indeed other
>programs which shell out to TTPs for some operations please?

If you install TOS2GEM in your auto folder, they will run in windows, though I never found this to be too wonderful as something messed up the fonts (probably because I used the same small font (Connect ANSI) for both the font.view.big and font.view.small entries in O.INF). Almost certainly not a problem if you use the system font for your font.view.big.

WRT the main import/export/find utilities, you may find once you get started that running them from batch files with various switches/parameters applied becomes more convenient. For an example of one way of using these (for selective article downloads in 1.34 - I believe in v2 this is handled specifically) see:

http://www.whalley.demon.co.uk/atari/texts/selokami.html

Pop the batch file icons on your desktop or make entries in Start-me-up if you use it.

>I'm searching for an Internet-Browser for my atari-st!!! Please help me!!!

CAB 1.5 (free): http://www.flinny.demon.co.uk

CAB 2.7 (commercial): ASH (Germany), System Solutions (UK), ? (US) - demo available from ASH site. For URLs/email addresses try Hallvard's Atari Launchpad:

http://launchpad1.atari.org/

There are others (Light of Adamas/Draconis, WenSuite) which aren't anything like as stable. Again, Hallvard's Launchpad is a good place to start.

You will also need a TCP/IP stack: STinG is the best for most purposes under TOS or MagiC. If you run MiNT you may find MiNTnet more to your liking. CAB will also need an appropriate OVL file (the glue between the browser and the TCP/IP stack).

For an *entirely biased* take on Atari net software, check out:

http://www.whalley.demon.co.uk/atari/a_net.html

You have to use TOS2GEM in the Auto folder for this but, if using Thing,
you don't have to enable Thing's use of TOS2GEM. Then outside of Okami,
Thing use's MagiC console window.

Hey, what can I say, it works.

It was nice to meet a few of you at the Neuss show and catch up with some old aquaintences. The show was slightly smaller than last time (inevitable in a shrinking market) but it was more lively than the last Spring Neuss show.

There was a nice new English/German dictionary programmed by Ralf Zimmerman and Funpaint looks excellent for putting together video sequences and manipulating images.

Delta Labs didn't turn up and I understand their Revolution CD magazine will no longer be produced.

As usual we sold plenty of copies of Atari Computing and launched our renegade evolution # 2 CD-ROM.

There were a few missing faces, no Thomas Much or Thomas Binder but Alexander Clauss was there on the Saturday and I asked whether any of the features in iCAB for the Mac will filter back to the Atari version and the good news is the faster image handling code provided by the Behne brothers should migrate back to the Atari version. The response to the iCAB web pages have been overwhelming.

I had a great evening out with Nick Harlow (16/32 England), Paul (MABN Holland) and Thorsten Butschke (our German AC representative) and several others and look forward to doing it all over again this weekend in Stafford!

use the modem port, it's easier

ingredients
2x 220 ohm resistors
female 5 pin 180 degree DIN socket (ie midi socket)
25 pin female D-type connector
some single core wire
a box to stick it in

a pair of 'helping hands' is recommended as soldering to DIN and D-type connectors is fiddly

all available from Maplin's or similar

midi plug, from REAR (i haven't followed numbering convention as they are confusing for DIN plugs)

a
b c
d e
x

a=TOP
b=MIDDLE LEFT
c=MIDDLE RIGHT
d=BOTTOM LEFT (ignore)
e=BOTTOM RIGHT (ignore)
x=BOTTOM (ground tag, ignore)

d-type should be numbered so you don't have to get confused about 'numbers from front or numbers from back?' (get a different one if it isn't!)

Make the following connections

DIN pin c > 220 ohm R > D-TYPE pin 2
DIN pin a > D-TYPE pin 7
DIN pin b > 220 ohm R > D-TYPE pin 7

then stick it in the box!

Finally get Steinberg's export.drv/xport.drv, I've also seen it called modem.drv from Steinberg's FTP site and stick it in MROS folder, get most up to date MROS while you're at it

I'm not sure what Notator does with this box but I have heard suggestion that it will recognise it.

In Cubase, select 'Xport 1' from 'output' channel in arrange window

Works with *all* versions of Cubase ;)

good luck,
jim

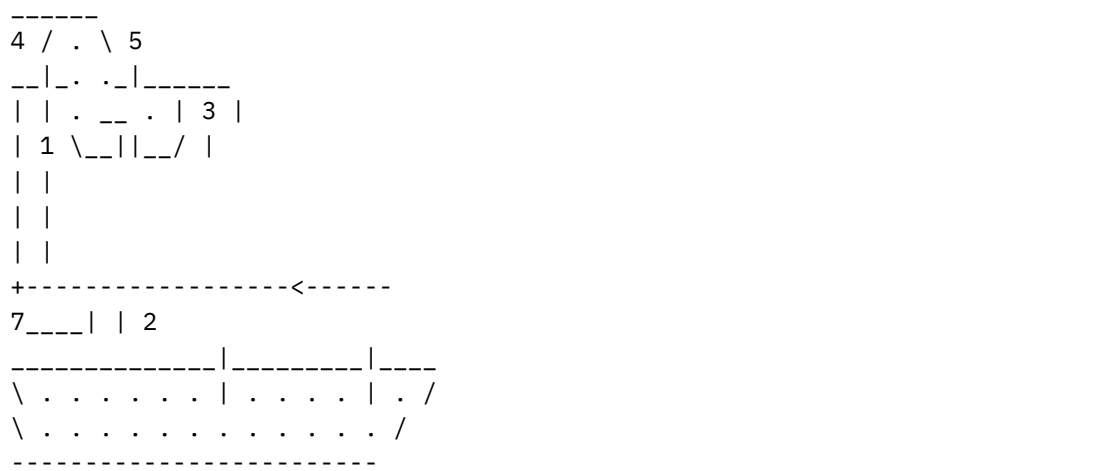
I know there is a schematic to turn the modem port into a second midi
channel by building a cable. I FOUND IT! here it is:

Well here it is at last how to add another midi out on your Atari, giving you
another 16 midi channels.

There are companies charging 35 quid for this, it will cost you about a
fiver.

make up a cable as follows (excuse the ASCII art)



This then plugs into the modem port on the ST. Hey presto another midi out.

To use the modem 16+ interface you will have to activate the Export
driver in the MROS folder. This is done by selecting the export driver.
Go to TOS and select show information, add a V to the end of export.dr_.
Restart the computer. When Cubase is started again you will see 3
outputs labelled export and the 1st one will work with your Modem 16+.

>> Info from Greg Ondo, Steinberg/Jones

Hope this helps.

I am also interested in other ways or even a Commercial way to add
midi ports. would Unitor II for example work on Cubase, or edit track?

I recommend CAB :)

Hmm, I wonder how you download a browser when you don't have a browser
to download it with :P

CAB 1.5 is free, all other versions need to be purchased unless you
are lucky and get given it in a bundle of software :P

AM.

I think therefore I AM.

Not sure about Unitor Tim. I know Steinberg had their own, was it called Midex? I recently got the Noboxe 48 Expander. Gives 3 midi outs. It's 39 ukp, it comes in kit form only, if you bodge its assembly you can return it and they'll build it for another 15 ukp. It's not particularly difficult to build but at least 1 or 2 previous projects experience would certainly be helpful.

I'm pleased with the Noboxe, seems to work well. I mounted it internally in my STe, fits snugly under floppy with extra midi ports above modem and parallel port. Involves drilling through STe case. Gulp! It all went a bit wrong ...

general advice re drilling through STe case (should you be so stupid ... like me)

1. Use a drill bit for metal and plastics
2. Drill VERY VERY slowly
3. Use a guide hole
4. Start with small drill bit and increase a few mm each time

If like me a large chunk of your STe case goes flying across the studio then superglue it back but get it right as superglue quickly corrodes the soft plastic.

jim

Hi, I'm selling the following system on Ebay right now:

1040 st complete system, with sm124 monitor, sf354 disk drive, mouse, cables and a bunch of software

and a bunch of non ST stuff you might be interested in.

Atari 800

Atari 1020 color printer, new, unopened in box

5200 game system with 2 controllers and 5 games

Adversary game system (National Semiconductor) in box

S Four Thousand game system (made by Kmart)

2 semi-working Super Pongs (1 Atari, 1 Sears) - both turn on, and both have weird problems of their own.

plus some assorted games for various systems, all in original packaging:

Dr. J/Larry Bird Go One On One (IBM) still sealed

Gauntlet (IBM)

Wasteland (Apple II)

Bard's Tale 1 (Apple II)

Ultima Online (pc) with 2 strategy guides

Sid Meier's Alpha Centauri (pc)

OK, I think that's it for now! Thanks for looking.

use this link:

http://cgi3.ebay.com/aw-cgi/eBayISAPI.dll?MfcISAPICommand=ViewListedItems&userid=alankay

(you might have to cut and paste the whole thing, sometimes whatever is after the "&" isn't part of the link)

or you can go here:

http://pages.ebay.com/aw/search.html

and in the "seller search" box type in

alankay

Thanks!

Alan

Its that time once again! (thunderous drum-roll please-if you don't mind) The Winners at the DarkForce! BBS this month are as follows:

1) Starlord (Dennis Bishop): 1 6 month/3 volume subscription to Atari Computing!

2) -On Hold- : ST-Plus Fanzine!
3) -On Hold- : ST-Plus Fanzine!
4) -On Hold- : ST-Plus Fanzine!
5) -On Hold- : ST-Plus Fanzine!

Congratulations to all our lucky winners. Don't forget-you too could be a winner if you call our BBS at least one time each month. All it takes is that one call, and it does not matter how long you stay on. Good luck to all of next months' callers! ;-)

PS You must take a permanent password when you call for the first time! ;-)

Hi Freek

>Today i read an article in an old ST Format issue about an operating system
>called SMS2 for Atari .It came as a cartridge to be plugged into an ordinary
>1040.It's supposed to be multitasking and lightning fast and related to Unix
>and VMS.

There was also an article about SMS in the March 1996 issue of Atari
World.

>Does anyone know anything about this? Can the code be downloaded from
>somewhere and possibly be loaded from HD?

I did speak to the guy involved with SMS in 1997 sometime. They were
interested in taking some advertising in AC magazine. We had a long
talk, and they did have lots of assembled cartridges ready to sell.
Anyway, I did not hear any more from them.

You could try this email address and see if there is a response:

furst_uk@delphi.com

The name of the company was Furst Ltd. Maybe you could try a web
search and see what comes up?

Kind regards

Mike Kerslake

Have I spoken to you before?? I notice you're on zetnet, though your
name doesn't ring a bell - maybe I just ignore the author field these
days!

Anyway, yes I have *several* Ataris and live in Gwynedd. I won't be
coming to this show as it's a little too far for a Sunday, although
I've been to every one up to now. As proof, in Issue 12 of AC you can
see me with my back to the camera - I'm the balding one carrying a
plastic bag (I think, unless anyone else lays claim to the photo!).

>and it would not find it at all, I think my HD driver is just the normal
>Falcon driver for IDE drives supplied by Atari. WIll this new V7.xx driver
>read PC drives ? if so where can I get a copy ?

I just put a IBM Travelstar 2.5" 3.25 Gb. IDE drive in my Falcon, and it works fine. The type they use in the notebook computers.

Check if the jumper is in place, it turns out that I didn`t need one
on the new drive. My HD utils didn`t find the drive with the jumper in
the same place as on the old 130 Mb HD.

When I had a closer look at the new drive, it had the tech data on the
cover, I just didn`t see it at first. After removing the jumper it worked right away.
Actually one can say it worked right out of the box with AHDI
program.

cheers

2
>or 3 hours on it yesterday, nowhere complete but more or less functional.

Once you've got the configuration sorted out, though, you only have to do minor edits now and again. The learning curve is rather steep, I admit. Personally I never could get on with NEWSie's interface, and I had redraw problems etc. What finally killed all interest for me was the number of people who seemed to have trouble with it doing weird low-level things corrupting drives. Not sure if it's fixed now, but it rather put me off it.

>It's running but I can see that there is plenty to get to grips with, for
>example there's a problem with the comp.sys.atari.programmer newsgroup.
>Okami says that this doesn't exist when I click on its name in the group

>the message base on a VFAT partition.

May be: I never used it on a VFAT partition and never used that newsgroup with it, but ISTR there were some reports of problems with LFNs and VFAT partitions under MagiC: apparently it's fine under MiNT/MinixFS, FWIW.

Maybe someone here who uses it with MagiC/VFAT who knows more?

>Okami seems to have created some Amiga
>related database files too, heaven knows what's going on!

New one on me: have you got them listed as active in O.INF, possibly?

>when sending messages through the Internet.
>
>What needs to be done to get this riht?

When sending on Internet characters with codes > 128 one should use
ISO-8559-X character encoding.

For example:

ISO-8859-1 covers national characters for Western Europe (i.e. Dutch,
French, German, Spain, ...), but it is different from the Atari
character set.
ISO-8859-2 covers 12 languages of Eastern Europe (Albanian, Czech,
German (again), Hungarian, Polish, and so on ...)
ISO-8859-3 it is Esperanto, Malteser, ...
ISO-8859-4 is cyrilic (as I recall)
and so on ...

>Built a German TOS in my TT (and a French and a Spanish)?
>
>I simple want to read German, French and Spanish messages with the
>right characters on my screen.

You need a newsreader supporting ISO-8859-X standards.
The only one for Atari is OKAMI. It is one of the reasons I love this
programm.

NEWSie doesn't support character rempapping. If you're using the Monaco system font, visit the URL below and download a special ISO 8859-1 version of it for use with NEWSie or FireNews:

http://www3.bc.sympatico.ca/roughley/monaco.htm

Note the link is down at the moment because of system maintenance.

: chrisc

I have an absolutely untested idea. Calamus has been refusing to load
sometimes, and relogging drives fixes that. It seems to have started when
I added in a SCSI tape backup unit, which I leave powered down, or else ICD
PRO gets confused by logging a drive which is not really a drive.

On another machine, I have an old unix home drive that refuses to work
unless there is an active terminator on its unused connector. That machine
an STE, runs HDDriver.

There is such a thing as an active, in line, SCSI terminator, with Centronix
connectors on both ends. I have one. I may yet try that in various positions,
to see if that makes a difference. It looks like it was built for a purpose,
and does something useful with stubborn SCSI setups.

I bought Ge-Soft FastRAM card for TT Mighty Mic 64
I need jumper settings, and how memory banks are organized
(which SIMMs are bank 0 and which are bank 1)

I found 16 slots for SIMMs, and 16 Mb looks like this:

```
back
---------- ----------
---------- ----------
---------- ---------- ----------
---------- ---------- ----------
---------- xxxxxxxxxx ----------
xxxxxxxxxx xxxxxxxxxx xxxxxxxxxx

front
```

xxxxxxxxxx = 4 Mb SIMM in, ---------- = empty

How can I put 32 Mb ?

771. Zip Disks

Date: 1999-04-14 00:00:00 UTC
From: John Graser <john.graser@bctonline.com>
Message-ID: <7f3eoi$pa9$1@nntp.or.nw.verio.net>
Source record: 80768

I'm tring to use Zip disk between an Atari Falcon and a PC with Win 98.
I heard you could format them with 4 Partitions and both the PC and Atari
could access the same disk. If I formatted a disk on the Atari only the
Atari recognizes it. I am not sure how to partition the zip disk in
Windows to 4 partitionsin case this will help?

Any ideas what I'm doing wrong?

772. Characters right

Newsgroup: comp.sys.atari.st
Date: 1999-04-14 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <7f1jufflh4@news1.xs4all.nl>
Source record: 80795

MY brother has a W95 machine.
After many months he has the fonts on his machine good.

This means: all messages that come in are shown on his screen with
the right characters. French German, Polish, Dutch, etc.
Even he managed to get some Unicode fonts with Thai and
Devanagiri script in it and managed to put those in his Windows.

Also WWW-pages show OK on his browser. Japanese WW-pages go wrong but
he is busy trying to get that right.

he uses Papyrus PC for text.
And he can make realy multilingual text: a piece of german, followed
by a Polish quotation, a comment in French etc.

He is happy.

I am not. I also can use Papyrus and do the same things as he does
with it (I borrowed his fonts) but:

Internet messages using non-American characters are put on my Atari
screen with the wrong characters.

Is it a question of outdated Atari software or are there simply no
solutions made yet?
They talk about ISO but how do I use that.?

It's available, if you run MiNT. It's called mICQ.

Not a program but

On the net (Yahoo searchmachine) there are places where you can send
a document to be automatically translated.

Mostly only 1 or 2 A4's at a time for free.

Hi Hallvard ... see post above for details of Noboxe48, an easy to get hold of commercial expander (www.padworld.demon.co.uk). Also there was a recent thread on this very subject, scroll up and you might find it. To recap: to squeeze 3 midis out of modem port requires a non-trivial circuit and software drivers. The technique employed as I understand it is to quickly switch the status of one output to three destinations, 'port switching'. As for reverse engineering the Noboxe it's creators rather wisely permanently obscured the ID's on the three IC's that it uses.

rats,
jim

779. Newsie killfile

Newsgroup: comp.sys.atari.st
Date: 1999-04-14 00:00:00 UTC
From: paul.williamson@zetnet.co.uk
Message-ID: <7f21ta$6bt$1@roch.zetnet.co.uk>
Source record: 80802

Hi all,

I seem to remember a recent request to help out with a Newsie killfile problem (which was solved), followed by some comments about having to check all the mailboxes once the mail had been sorted, as there was no immediate way of knowing what had been put where.

If you activate the logging (which I know most folk avoid because of fears of disk corruption) then you can use the "show log file" feature to see where the mails have been put.

Cheers

Paul

I've been working on that from time to time. I'm having some
problems with version 4, which I've been told doesn't run properly with
MiNT net either. I've been trying to get some information out of the
developers list for micq. But so far no luck.

Please don't email me over this. If I can get it working, I'll
make the binary and the converted source available from my page. I'll
make an announcement in here as well.

>http://www.whalley.demon.co.uk/atari/texts/selokami.html

Thanks, that's another good hint!

>Pop the batch file icons on your desktop or make entries in Start-me-up if
>you use it.

Plenty of opportunity for automation with all this by the sound of it! :-))

I have to say tho' that I'm rating NEWSie above Okami. It's much easier to
set up and is quicker downloading news IME. Okami is ultimately much more
powerful but one pays the price with configuring that o.inf file - I spent 2
or 3 hours on it yesterday, nowhere complete but more or less functional.
It's running but I can see that there is plenty to get to grips with, for
example there's a problem with the comp.sys.atari.programmer newsgroup.
Okami says that this doesn't exist when I click on its name in the group
list - although it imported it without complaint. An issue with LFNs? I've
the message base on a VFAT partition. Okami seems to have created some Amiga
related database files too, heaven knows what's going on!

I'll probably stick to NEWSie but I'd like to know the answers nonetheless!

Robert, I know you observe this newsgroup so maybe you can help me..

For the last 2 weeks, 3-5 times daily, I've been trying to get the DOITST1H.ZIP file from ftp.rhein-main.de/pub/atari... All I've gotten so far is:

unknown host
server closed, access denied
EOF from remote server

This is trying Newsie 0.94, Aftp15b (MiNT), and using MiNTs own ftp facilities from root (tty1/vcon). No go, no go, no go, can't "DO IT" from here...(USA) ;-)

Can anybody point me to an alternative (mirror) ftp site? Thanks in advance! ;-)

Well, that's a little closer to what I should have said. Steve just said to me that they are not currently putting time into the project. They do have all sorts of details in the works, but as I understood him, it is currently on the shelf until a later date, not that developement has stopped completely. I don't think they will follow through with a Falcon accelerator. Steve has said on many ocassions that it is too difficult to develope a "drop in" solution for the Falcon, especially as their "developement funds" were cut quite a bit this year. Hopefully their venture into the PC market will reward them enough to get back to the real world of TOS computing;).

Mike

Message-ID: <7f2l99$34p$2@news5.svr.pol.co.uk>
Source record: 80817

For those of you who missed issue 1 and 2, goto the link below and you
should find issue 1 and 2 there......

ftp.funet.fi/pub/atari/mag/mega/

Issue 3 is in the pipeline to being uploaded to the FTP site, though I'll
try to add it to my site this week....

www.users.zetnet.co.uk/mega.disczine/

Mega disczine is a Atari mag based in the UK, a handfull of Atari people get
together to write the zine from STOS basic on the ST. The whole team is
STOS related so if any of you want to chat to us then you can mail me or
come to our chat room anynight from 9pm (info below). Mega Disczine's aim
is to cover not only Atari reviews and projects but also to cover more
interesting material such as ghosts/space-time anything which we may call
"alternative science". Follow my work into strange devices and special
projects also. Issue 1 & 2 will run on the Falcon as it was actually written
on STOS on the Falcon to make sure the code was compatible so if you have
problems let me know and I'll be happy to help you out.

You can mail me at chris.swinson@zetnet.co.uk or come to my IRC (chat
room)
on the X-net server from 9:00PM (UK/ London time) , the chatroom is
called #mega_disczine

I don't know of any Atari chat rooms, there are far to many servers to hunt
though so if you know of any rooms anywhere then please let me know !!

Feel free to mail me or stop by my chat room, most of the crew are online
weekends mainly but I'll be there every day from 9PM, hope to see a few of
you stop by soon !!

795. IBM-Falcon HD

Newsgroup: comp.sys.atari.st
Date: 1999-04-14 00:00:00 UTC
From: Chris Swinson <chris-swinson@mega-disczine.freeserve.co.uk>
Message-ID: <7f2l9a$34p$3@news5.svr.pol.co.uk>
Source record: 80818

I have a PC formatted IBM 1.2 gig drive 2.5" IDE, I tried it in my Falcon
and it would not find it at all, I think my HD driver is just the normal
Falcon driver for IDE drives supplied by Atari. WIll this new V7.xx driver
read PC drives ? if so where can I get a copy ?

thanks in advance !!

chris.swinson@zetnet.co.uk

P.S. can you mail a reply to me direct also, thanks !

796. Calling UK Atari people

Newsgroup: comp.sys.atari.st

>can you ram an fpu in any ST and expect better performance? A bargain if
>you can surely?

Not in an ST. The STE has an empty socket for a 68881/68882, I beleive, and so does the Falcon. The TT has an FPU as standard.

It will only be used by programs specifically compiled to take advantage of the FPU. These programs usually come as 2 executables, one that doesn't use the FPU and the that doesn't.

No Chance. The fastest PC emulators for the Falcon were 286. I doubt an accelerator board would accelerate it since it uses it's own processor. Not to the point of running Quake anyway.

I'm not sure. You can download it from somewhere. Have you looked at the usual FTP sites and done a web search for "Falcon" and "BadMood" ?

I'm afraid ScanX will never support this scanner because Nima sells another
driver called Nova scan which is intended to support HP scanners and
perhaps Epson ... Am I wrong Nima ?

> Does anyone know where I can get hold of a program that will translate
> German text into English text?

Apparently there is a program called GEMTrade, sponsored by Atari Computing, that does just that. It's based on the dictionaries of Ruftrade and features a modern GEM front end. I haven't registered a copy yet, but it can also run with CAB as a module and translate HTML pages without loosing the HTML! AFAIK, the current email-only registration price is 6.99 UKP, and these key only registrations are apparently available at the show this weekend.

Hope that helps.

Oh yes, the web site is http://www.rvmp.co.uk/gemtrade/

Best wishes,
Mark.

Everything correct so far.

> Works with *all* versions of Cubase ;)

Not really... Don't try to use it with Cubase Audio on a Falcon - you
simply won't be able to get it working :(
On the Falcon you'd need SoundPool's MO4, which gives you 4 extra outs
from the printer port.

Source record: 80874

yup well remembered, it don't work on the Falcon nor do any of the
commercial expanders such as Noboxe48. Not sure what a TT will make of it
either.

by *all* versions of cubase I was kinda referring to the, ahem, shall we say
extended demo version, which rightly or wrongly many people use ...

we need a cubase crack FAQ, should go something like this
1. Don't ask for it on comp.sys.atari.st
2. Sooner or later it will let you down, badly, miserably, horribly
3. No there aren't any reliable cracks of v3

and for the truly adventurous

4. No you can't borrow my dongle to see if you can reverse engineer it !!

;) jim

I haven't found any *reliable* ones of CAF either...

> and for the truly adventurous
>
> 4. No you can't borrow my dongle to see if you can reverse engineer it
!!

Maybe still another - how about:

5. No - the Midex/Midex+ doesn't work with _any_ of the cracked
versions... Buy the original instead ;)

It's true - I tried it to see if I could manage without the key in the
studio (I always kept forgetting the key cartridge when I went there),
but not one of the cracked copies would work with the Midex - so I still
had to try to remember the d-n key for my original Cubase... Now. it's a
little easier since I have the studio at home ;)
BTW - the Midex doesn't work with CAF either, but that's a different
story...

> (i.e. 68000) or are only the browers supporting JavaScript?

I think there is a Java VM for MiNT, but it is non-graphical. I also hear
that it requires a 68030 and oodles of RAM (16Mbyte Falcon owners will be
struggling apparently!).

None of the browsers support Javascript yet. Draconis seems to be headed
towards Javascript first but in my opinion they should concentrate on a
little better adherence to HTML 3.2/4.0 first before adding Javascript.

CAB authors don't appear to be interested in adding Javascript/Java...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. E-Mail me or call me at
440-286-2567 evenings EST. I am also open to trade offers.
E-mail me your list to ap748@cleveland.freenet.edu

HARDWARE

I have a real gem here. The only known stand alone Atari 2600
computer system made. The Bit60 Computer made by Bit Corp.
Spectravideo made an add on adapter for the 2600 console.
This is a fully functional computer and 2600 game system.
This is the 2600 computer system reviewed in
"The 2600 Connection" issue #30 Sep/Oct 1995. I am pretty
firm on the price since this is not something your going
to find at a local flee market or garage sale. $1,000.00

Genuine Atari 2600/7800 Developers Kit. Kit was originally designed for Atari
ST line of computers. But with all the Freeware/Shareware/Comercial ST emulators
A Mac or IBM you can develop games on besides a real ST computer. Comes with
roughly 700 page manual, diskettes, and the developer board that plugs into the
Atari 7800 cartridge port. Compiles are downloaded via the computers parallel
port to the devolopers board in the 7800s cartridge port for immediate running.
$250.00

Falcon Speed by Sack Electronic
Intel 286-16mhz IBM processor board for the Atari Falcon computer
Run DOS and Windows 3.1 programs on your Falcon
Norton SI Factor of 12
Sound Support
Up to 8 Meg of IBM RAM
VGA and SVGA video modes 640x480, 800x600, and 1024x768 under Windows 3.1
Switch back and forth between TOS and DOS modes $100.00

Syquest 5 1/4" 44 meg removeable cartridges. Will be HDX formated and
verified good. each $15.00

Atari SC1224 Color Monitor. Unit is in perfect working order.
Comes with power cable. $50.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,

box, and an extra disk of misc ST utils. $40.00

Supra 2400 baud external modem. No power supply. $2.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 as a stand alone fax machine.
Comes with special fax modem, diskettes, and manual. $30.00

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

Conquest of Camelot by Sierra. Complete with box, docs, and disks $8.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $9.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $15.00

MISC SOFTWARE

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual. $5.00

BOOKS $5.00 each unless noted

Compute's Technical Reference Guide to Atari ST TOS Vol 3.
Includes fully commented C and machine language examples. $5.00
Thunder! The Writers Assistant manual. $1.00

Atari Computing Magazines $6.00 each with cover disk

Issues # 4 5 6 7 8

MAGAZINES

I have a large selection of mostly 80's and early 90's Video Game and
Computer Magazines, Books, and Newsletters for various systems.
Please E-mail me for a current listing.

Hi Chris
As far as I know, Draconis Pro 1.6 does support Javascript and
was released at last weekends Atari show.
I could be wrong?

HI

There is a program called RUFTRADE that does the job. Most Atari FTP
sites have 'em .Look in Languages or Utilities. Sure helps in translating the docs
for some of those (excellent) german programs into english. There is another
program, but do not know the name...anybody?

Hope this helps

Java VM will never work on an ST, it needs at least 16Mb RAM and even on my PII at work, it's a real dog. There is a port of Kaffe (Gnu Java clone) for MiNT, but it needs at least an 040/060 and 16Mb.

Javascript might be possible, but no browser currently supports it.

Java on an ST wouldn't make any sense. The ST hasn't enough memory and
is much too slow. Even a TT has not enough power for Java.

And did you actually look that I included *all* of the previous postings (apart from .sigs) - there had been no mention of FTP in response to the original query at that point on my local news server. So maybe *you* should check before you criticize.

And as to your smiley, it's not exactly obvious - more of a bemused smirk.

844. Strange SCSI behaviour

Newsgroup: comp.sys.atari.st
Date: 1999-04-14 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <7f1ju9flh2@news1.xs4all.nl>
Source record: 80893

My setup is:

Quantum 500 Mb HD with termination ON (jumper)
TT with no terminators on the board
25p to 50p converter
flatcable 40 cm (50p)
Syquest 44Mb exchangable (terminator removed)
round cable (50p) 25 cm
CD ROM NEC CDR 510 (terminators removed)
cable 100 cm round 50p
Epson scanner Gt9000 (terminator switch SW=OFF)
passive terminator 50p

Using HDDriver scanning all SCSI the following is observed:

when there is no disk in the Syquest the CD-ROM is found and used by
SPIN.

As soon as there is a disk in the Syquest drive (does not matter
which disk, any non-bootable will do)
the CD-ROM is not found on the SCSI when booting.
ID-check with HDDriver shows him available.

Syquest ID=0 and Quantum (the internal drive of the TT) is ID=1.
CD-ROM is ID=3 and scanner ID=4. TT ID=7

Anybody any suggestion?
This behaviour is a mystery to me.

Met vriendelijke groet,
Ronald van der Kamp
secretaris Stichting ST

845. Characters wrong

Newsgroup: comp.sys.atari.st
Date: 1999-04-14 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <7f1jucflh3@news1.xs4all.nl>
Source record: 80894

I first explain before asking the "Burning Question".

I use Newsie for mail and newsgroups.

No problem when typing English to this group on my qwerty keybord on
my TOS-UK TT.

But I also get messages from Germany, from France and from Spain.
From people using their Atari with local TOS-version and also Newsie.
When I need German characters (umlauts) or French accented chars
then with QED or First Word PlusI can pick those chars out of the
system charset of Atari.

But when I recieve messages with nationally used 'strange' (=non
American Ascii) chars they appear wrong on my screen.
An 'a' with a umlaut on it I recieve totally different from what was
typed in onthe other end..
But seemingly within Germany they have no trouble with their chars
when sending messages through the Internet.

What needs to be done to get this riht?
Built a German TOS in my TT (and a French and a Spanish)?

I simple want to read German, French and Spanish messages with the
right characters on my screen.

Can anybody please explain this all to me? All needed chars in my
case are in the Atari System charset.
So what is the problem?

Met vriendelijke groet,
Ronald van der Kamp
secretaris Stichting ST

: >can you ram an fpu in any ST and expect better performance? A bargain if
: >you can surely?

: No. IIRC only the TT and Falcon have sockets for the FPU.

: Even then the application needs to be programmed to recognise the FPU
: and use it (rather than the s/w FP routines).

True, but: in the hardware hacks site, and for those familiar with soldering small things, there are fairly simple insruction for putting one in. Since I also have a TT, I have not gotten a round tuit on my other machines.

There are many little utilities ported from unix, and such programs as Ghostscript, that come with both no-fpu and fpu versions. So, there is some use for an fpu if you have one.

849. WANTED: Manual and info for the Mega STE's

Newsgroup: comp.sys.atari.st
Date: 1999-04-15 00:00:00 UTC
From: Steve Stupple <Steve@steverosie.demon.co.uk>
Message-ID: <SWSC6OAjZfF3Ewfj@steverosie.demon.co.uk>
Source record: 80698
Cross-posted to: comp.sys.atari.st,alt.atari,comp.sys.atari.st.tech

I am after a manual and details fro the Mega STE computer. I need to
know what is what inside; where the internal SCSI fits and the pinouts,
and what fills an empty socket.

I would also like info on the 'LAN' socket.

ANY help & info for this machine will be VERY appreciated.

Thanx

Hi Keith,
As a matter of fact, I have written the code to do the
handling of Epson GT scanners as well, but I just don't have
a scanner to test it with. If I somebody lends me the
scanner for a week, I will have ScanX fully working with Epson
scanners as well.

Hiya ...

is there a Falcon specific FAQ?

If not help with any of the following appreciated ...

1. TOS 4.01 vs 4.04, I've heard 4.01 is to be avoided as it's buggy, suppliers/cost of upgrade in UK?
2. The Falcon has a SCSI-2 and an IDE interface, so can I bung any old SCSI drive on the back and any old IDE drive inside? Any other issues relating to drives, maximum size? Is HDDriver a must?
3. Will Cubase (other than CAF) work on Falcon?
4. Falcon happy with any VGA monitor, I mean any? Are all resolution modes accessible with a VGA, ie ST hi-res?
5. Cost/supplier of audio mods in uk, ie line level and clock mods?
6. Anyone know of a free/shareware audio multitracker that can be midi synced/slaved to my STe?

tia,
jim

Hi Jo,
NovaScan supports Mustek and HP only. Epson support so far is
only available by GT Look from Digital Arts.
I can provide Epson support as long as I can get hold of an
Epson scanner.

kennethm@tripnet.se (Kenneth Medin) wrote:
> Just got this article in the since long dead comp.sys.atari.announce
> group. Looks like someone is able to moderate it?

Yes indeed!

After a lengthy hiatus, the newsgroup comp.sys.atari.announce is
back. I have taken over as moderator, and just approved a posting, the
group's first in years.

I plan to update the group's charter, and will work with the Atari/Usenet
community to make the newsgroup as useful as it can be. c.s.a.a will be a
low-volume newsgroup offering news about Atari software, hardware, Web
sites, and other information relevant to Atari users. Articles may be
related to Atari 8-bit, ST, Portfolio, and PC clones.

I would appreciate your help in getting the word out about
comp.sys.atari.announce -- after such a long lull, I'm sure many
Atari-loving newsgroup readers have forgotten about this newsgroup. Of
course, I also invite folks to post any Atari-related announcements to the
group.

From what I've seen of Atari manuals, it wouldn't tell you much of this I guess. The manuals cover how to use the desktop and that's about it.

>I would also like info on the 'LAN' socket.
>

The "LAN" socket is an appletalk compatible serial port. You can use it to connect a Mac modem cable.

>
>1. TOS 4.01 vs 4.04, I've heard 4.01 is to be avoided as it's buggy,
>suppliers/cost of upgrade in UK?

Difficult, I'm not even sure Atari made TOS 4.04 available as an upgrade.
Don't worry though, it shouldn't be too bad.

>2. The Falcon has a SCSI-2 and an IDE interface, so can I bung any old
>SCSI drive on the back and any old IDE drive inside?

Basically, yes. The connector is SCSI-2, but it's actually a plain SCSI-1 in
disguise. They are compatible anyway. Inside, you should use a 2.5" drive,
otherwise you'll need a special mounintg bracket.

>Any other issues
>relating to drives, maximum size? Is HDDriver a must?

Not a must, but it's faster and more reliable. You can get away with AHDI if
you're short on money.

>3. Will Cubase (other than CAF) work on Falcon?

Not Cubase 2.x because of the dongle. Cubase 3.x and later will work fine.
Of course, without audio.

>4. Falcon happy with any VGA monitor, I mean any?

Yes, any VGA will do, but you need an adapter. You'd also need one if you
run it on a TV or an SM124.

> Are all resolution modes accessible with a VGA, ie ST hi-res?

Yes for ST-High, but the RGB modes are not. In VGA the Falcon displays 480
lines. In RGB it'll be 400 (with flicker). Only some demos were programmed
with RGB only in mind.

>5. Cost/supplier of audio mods in uk, ie line level and clock mods?

In France it's 400F (UKP40) for the whole shebang (line, clock and cinch
sockets).

>6. Anyone know of a free/shareware audio multitracker that can be midi
>synced/slaved to my STe?

Digital Home Studio from SoftJee. It works like a tracker and syncs to Midi.

SMS2 is some kind of variation on QDOS (the Sinclair QL's OS).
IIRC, they use something called SMSQ in modern QL compatible hardware.

>1040.It's supposed to be multitasking and lightning fast and related to Unix
>and VMS.

Related to Unix _and_ VMS?
Could anything possibly be related to both of those? ;-)

QDOS certainly isn't very similar to Unix at all, though it definitely
is a rather nice multitasking operating system (especially for its time).

>Does anyone know anything about this? Can the code be downloaded from
>somewhere and possibly be loaded from HD?

Probably not, but you can run QDOS itself on a normal ST/Falcon using
QLem (see .sig).

I'm on the look out for a scanner , and was just about to pick up
a hand held when I saw this article , where can I pick up a UMAX
scanner?

Many thanks,

Paul Mac

Bonsoir,

I'm very interested by an update of the hybrid arts "SMPTE TRACKS"
In fact it's the only soft i own with the proper interface to read and write
smpte code, so....

cordialement,

Well I gather it is something to do with the small claims being only able to issue an advisory. If you wanted (and had to) chase it to its fullest extent i.e. send the police in then you need a full court order which is mucho more expense and hassle.

>Why cant the court order the payment?.
It can only initially issue an advisory which then (if needed) can be persued. At least that is the way I understood it.

876. NEMESIS for Me

Newsgroup: comp.sys.atari.st
Date: 1999-04-15 00:00:00 UTC
From: Nurmix@NO_SPAM_MEsocal.com
Message-ID: <7f5hkd$q1d@enews2.newsguy.com>
Source record: 80725

Well, I aquired a NEMESIS board from a guy in Finland, and I'm getting ready to install the thing (or failing that, have Alex at ATY do it for me). I wanted to find out a few things from those of you who have NEMESIS installed in their Falcons.

I remember others mentioning problems if your RAM isn't up to snuff. I upgraded my Falcon long ago with a 16 meg SIMM, but I don't recall the exact type or speed of it. What RAM type, speed, etc. is recommended for trouble free NEMESIS performance? And, is it still readily available?

Does the NEMESIS upgrade actually eliminate the Falcon SCSI bug (where the drive will momentarily freeze up for a minute, then resume it's access - normally under 256 or greater colors)?

Will the NEMESIS increase the useable serial port speed on the Falcon? I can't seem to get anything higher than 57,600 on mine now (with HSMODEM).

Is there anything else I should know or check or have done when getting the NEMESIS installed? Basically, I want to make sure the job is done right the first time so I don't have problems later. I don't want to overlook anything.

Thanks for any and all advice!

Hi Paul,
You should be able to pick up UMAX Astra 610s or
1220s from any Computer store and mail order shops.
They are very popular in both North America and Europe.
In UK, you can contact Titan Designs or System Solutions
and they can help you pick up the software and the hardware,
or you can deal with Homa Systems House directly if you want to,
in case you pick up the hardware yourself.

contact:
homa@canada.com
http://www.magma.ca/~nima

Best regards,
Nima Montaser

Most of the ST midi expanders don't work on the Falcon. The only one I know
of (altho I'm sure there are others) is soundpool's MO4. Gives 4 outs and
weighs in at a cool 150 ukp ... not cheap!

Perhaps it might be possible then on a emulated Atari.

But why?

I've been experimenting with Java script off on my Macintosh browser to get the idea of what surfing on a non-java browser would be like, and while it's been turned off a month, I think my browsing has worked better.

I have found ONE site that did not work (the "Punch Bill Gates" site), and that is it. On the other hand, I have had one site that would not work at all with java turned on that I navigate through effortlessly with it off.

Let's face it, besides cute little programs that dance around that are DOWNLOADED INTO YOUR COMPUTER to run (which is again not a good idea....) what does java accomplish?

Thanks for the mention Rob! :)

Yeh, if you're looking for a chatroom to join in, you can E-mail some people and meet at www.atariusers.com/chat at any time... or join us each Saturday from 8-10pm Central Standard Time and we usually have a general chat session going. *
Once a month we bring in someone in the Atari scene. So far we've had Kent Kordes of Systems for Tomorrow, Jim Collins of Chromagic, and Roger Burroughs maker of ExtenDOS. We're working on more guests ranging from developers, vendors, and so forth.

We would *LOVE* to get a EUROPEAN CHAT SESSION going, and though Titan expressed interest, the word is the same... a two hour chat session would cost MONEY for the time for being on-line. Bear in mind that people overseas do not get the free local calls like we do here. (Hooray for good ole competition of local phone companies!) Nevertheless, if YOU know of a European vendor or developer that would like to advertise through a question answer section and spend time with the Atari community ON-LINE... send me a letter! I will personally stay up and help host the chat session comperable to European time.

The good news about our chat site is that it does not use JAVA, and the no-frames version works most of the time with CAB drivers. :)
(That is to say, it will work with Atari browsers).

Come join us!

Doctor Clu

||| ATARI USERS OF NORTH TEXAS
)|(http://www.atariusers.com/AUNT

> you can surely?

No, only if you have software for..
(NeoN Grafix as example) (Neon needs an TT or an F030)

vuk-@geocities.com wrote:
: I bought Ge-Soft FastRAM card for TT Mighty Mic 64
: I need jumper settings, and how memory banks are organized
: (which SIMMs are bank 0 and which are bank 1)

: I found 16 slots for SIMMs, and 16 Mb looks like this:

: back
: ---------- ----------
: ---------- ----------
: ---------- ---------- ----------
: ---------- ---------- ----------
: ---------- xxxxxxxxxx ----------
: xxxxxxxxxx xxxxxxxxxx xxxxxxxxxx

: front

: xxxxxxxxxx = 4 Mb SIMM in, ---------- = empty

: How can I put 32 Mb ?

Are you anywhere near Systems Solutions in England? They sold those, have documentation on them, and their jumper settings, and if you ask nicely, might even fax you a copy. I have one of those, but cannot find my copy of that documentation. Will post an answer if I find it before this scrolls off of this newsgroup.

: I'm tring to use Zip disk between an Atari Falcon and a PC with Win 98.
: I heard you could format them with 4 Partitions and both the PC and Atari
: could access the same disk. If I formatted a disk on the Atari only the
: Atari recognizes it. I am not sure how to partition the zip disk in
: Windows to 4 partitionsin case this will help?

: Any ideas what I'm doing wrong?

On information and belief only, you need HDDriver to do a format that both
machines recoginize. If I am wrong, somebody will let me know about that.

>
>James:

Hybrid Arts was taken over by BAREFOOT software and they produced Edit
track Platnum. They are no longer however. I did hear that someone is
working on a new version. Time will tell. I really loved the Hybrid
arts stuff. It can do things that Cubase can't! For example, on the
barefoot version, it has a 3 -d control for controller messages on 2
axis's. On one midi channel, you can control panning (controller no
10) and on another you can control volume. You can move these
parameters in a "joystick" type fashion. Of course any parameter can
be assigned to any axis. Going off here!

B&C computer visions has Hybrid arts stuff still in stock!
Bruce originally set me up with Edit Track.It was my first atari
sequencer. I still use it. When the original Hybrid
arts version did not work on my TT, he gave me the upgrade (the
barefoot version) which Did!

http://www.myatri.com

I am sure Bruce has other hybrid arts stuff. Check it out.

898. FS: Winnipeg Atari ST User Group fundraiser still going! Reduced more!

Newsgroup: comp.sys.atari.st
Date: 1999-04-15 00:00:00 UTC
From: trevor@cyberspc.mb.ca
Message-ID: <7f3uoc$9cp$1@canopus.cc.umanitoba.ca>
Source record: 80779

GIANT ATARI ST HARDWARE / SOFTWARE / MAGAZINE / BOOK BLOWOUT!

Yes, our sale is still happening! All prices knocked down another notch. Check it out!

The Winnipeg ST User's Group (STUG) is having a huge fundraiser to help keep our still-going-strong user group in good health, clear out some useful software that isn't getting much use, and help members do the same. The majority of the proceeds from all sales will go directly towards helping the club which has been promoting Atari since 1986 in Manitoba, Canada.

Please look through our list and pick out something you can provide a good home to. All hardware/software is fully guarenteed for 2 weeks from receipt. Everything comes with full email tech support from a knowledgable STUG member, we'll try our best to help you out!

If you want a whole bunch of stuff, discounts are available. Let us know what you think is a fair price. We just want good homes for all this STuff!

Every item purchased includes an issue of the STUG Chronicles (our newsletter) FREE!

All prices are in US$ funds as most sales tend to be to the US and so it makes everything easier that way. Canadian prices should be calculated accordingly.

Shipping is extra and NOT included in the price listed.

Thanks for helping out our user group!

Trevor Cordes - STUG President
trevor@cyberspc.mb.ca

==========
SOFTWARE / BOOKS
==========

Diamond Back II - great backup program to most any media $3 `
disk only

Degas Elite - brand new! original disk envelope is unopened! $10
disk/docs

Prism render tt030 disk only - v1.03 top notch rendering program $13,

Chronos keyframe animator tt030 v1.3 - disk only - amazing animator for TT $15,

Chronos keyframe animator v1.3 3disks - disk only - amazing animator $15,

Cyber studio set - hundreds of dollars of great CAD/paint/render software!
cyber paint v2.1, cyber mate v1.1, stereo cad-3d v2.02,
cad-3d, plotter & drivers, human design disk, cartoon design disk,
cyber control - disks only $21,

Space quest 3 hint book (book only) $3,

GFA Basic Manual - appears to cover v3.0 and 3.5 and compiler 3.0 $4
book only

Michtron gfa basic version unknown, 3 ring binder (book only) $3,

Michtron bbs v3.0 (book only) $2,

Macro Mouse by Antic disk only $3 `

Migraph drawing utilities set - includes TouchUp, MergeIt and Scan&Save
disks only, manual for mergeit $7 `

SwiftCalc ST by Timeworks - great spreadsheet with graphing 2disks
disk only $8 `

Word Writer ST by Timeworks - great graphical wordprocessor
disk only $3 `

Interlink ST - packaging/box only (no disk, no manual), beautfiul $3
black plastic videotape style box with the company logo all
over; slides into a white Interlink box

Windows Internet Tour Guide BOOK - 344p softcover, includes CD-ROM with $7 s
everything you need to get a PC on the net with Windows 3.x,
have an old 2/3/486 lying around? get it on the net the easy way!

==========
HARDWARE
==========

SyQuest EZ-Flyer 230MB SCSI external removable hard drive w/1 cart $84 h
Perfect for a Falcon or TT with a SCSI port or any other ST with an
ICD Link or other host adapter.
This is the great little 3.5" SyQuest disk system that holds 230MB
per cartridge. It can read and write the older 135MB cartridges also!
It is in a rugged and cool-looking external portable case. It is a
quick and cheap way to add a hard disk or unlimited removable storage
to any system.
It comes with the A/C adapter, SCSI cable (depending on what kind you
require, email for info), one 230MB cartridge disk and the drive
itself. Everything is in perfect working order and there are no bad
sectors on the cartridge. It is guarenteed to work for 2 weeks after
receipt. Includes FREE shipping in cont USA/Canada!!!!!

SyQuest 88MB cartridges only $32/each or 5 for $119 h

Printer support stand - 2 plastic legs designed to hold the printer $4 h
up over the paper which goes underneath. Works best with larger
dot matrix printers and continuous feed paper. Sturdy smokey-clear
plastic and rubber pads to support the printer.

Chinon CDS-435 SCSI CD-ROM drive 1X - was working fine but one $10 h
day stopped accepting disks (it just ejects them);
this drive has had the ROM upgrade to make it more compatible
with other computers

CapeTronic 1200 baud external modem w/builtin A/C adapter & vol control $10 h.
great starter modem for an ST or 8-bit; includes phone cable;
serial cable for ST/TT available for only 5 bucks more

Packard Bell 1200 baud external modem $9 h
great starter modem for an ST or 8-bit; includes phone cable
and A/C adapter; serial cable for ST/TT available for 5 bucks more

Atari 1200 baud external modem - classic modem $10 h.
great starter modem for an ST or 8-bit; includes phone cable
and A/C adapter; serial cable for ST/TT available for 5 bucks more

GVC 2400 baud external "super modem" with full manual $17 h-
great starter modem for an ST or 8-bit; includes phone cable
and A/C adapter; serial cable for ST/TT available for 5 bucks more

Pengo 25-pin data switchbox (2 to 1) for modems or printers $10 h.

5.25" floppy drive mech, stopped working recently, perhaps revivable $3 h`

Mouse pad by Moustrak Inc. - grey $3 h=

Modem/serial/printer cable 25 male to 25 male Dsub approx 5' $5 h

Original Atari mouse, guarenteed working $12 .

ST/IME internal clock/calendar from Zubair Interfaces Inc, sets your $18 .
clock automatically every time you boot. Includes box,
software and hardware. Suggested retail was $57.95. Brand new.
No guarentee on lithium battery (estimated 10 year lifespan)

Atari ST VT-100 emulator cartridge, weird antique cartridge from way $8 .
back when. For the hardware collector buff. Plug it in and
boot your ST and up pops a TOS-based terminal program!

Syquest 44MB removeable hard drive w/1 cartridge $72 .
in 2-bay (1 bay free) "shoe box" style external case including
host adapter so you can hook this drive directly up to any
ST without an expensive ICD Link. The case has a DMA thru
connector so you can still hookup your SLM or another drive.
Includes DMA cable and software. Everything you need to get going!

Syquest 44MB cartridge $27 each; 3 or more $20 each

Monitor Master, switch between color & mono with a flick of a button! $3 =

Golden Image optical mouse - no ball, super light, amazing mouse! $3 `
minorly broken, button sometimes works and sometimes doesn't,
and it often doesn't want to move right; comes with special
gridded mouse pad

Atari SC1224 RGB Color Monitor $34
docs =

Atari SC1224 RGB Color Monitor - minor problem: the power button switch $19
won't stay pushed in unless you hold it; fix or replace with a
switch from Radio Shack; otherwise works perfect with great picture
docs =

Spectre GCR - the premiere Macintosh emulator - complete and upgraded! $31 =
disk/docs/cable =

Epyx hand conformed joystick $3 =

3 1/2" Oceanic America Master-3S external floppy drive $35 =

3 1/2" external floppy drive - unbranded, sturdy slim metal case $29 -
with floppy cable and power supply

Atari 3 1/2" external floppy drive; flakey - reads ok sometimes $18 -
but most of the time doesn't; perhaps fixable; sold as-is
with a working power supply and floppy port cable

Epyx 500XJ joystick - minorly broken, probably fixable or usable for parts $2 `

Atari Mega STe computer 16Mhz 4MB RAM, 300MB+ hard drive $288
HUGE PRICE REDUCTION - was $425!
Now with both a working keyboard and a keyboard with a couple
of broken keys (for spare parts), and also now with 4MB instead of 2!
Great computer with BIG hard drive.

Atari 520 STf $20 .
no floppy disk drive; includes power supply; add 5 bucks for a mouse

Atari 520 STf $43 .
with DS disk external drive; add 5 bucks for a mouse

Atari 520 STfm $23 .
dead internal power supply (looks like it melted down);
probably repairable or certainly usable for parts; this is the
model with internal DSDD floppy drive and TV output

External Power Supply for the Atari 520 ST $18 .

Atari 1040 STf bare $68 .
add 5 bucks for a mouse, 1 buck for a manual, 1 buck for a power cord

Atari 1040 STf bare, needs repair: slight wobble in picture output $33 .
and internal floppy drive is dead, everything else appears fine;
fix or use for parts;
add 5 bucks for a mouse, 1 buck for a manual, 1 buck for a power cord

Atari 1040 STfm $76 .

Atari external floppy drive $26 .

Atari Color monitor $42 .

Atari Mono monitor $32 .

2 Wico hand-formed joysticks $3 -
1 in perfect condition; 1 sticks a little

"IBM Services" mouse mat; attractive plastic over foam base $3 h

==========

Hi,

I use Okami on MagiC, but the partition it sits on has no VFAT enabled.
Works flawlessly though... I gather there's something wrong with Derrycks
"active" lines too...

>>Okami seems to have created some Amiga
>>related database files too, heaven knows what's going on!
>
>New one on me: have you got them listed as active in O.INF, possibly?

I recall the later fixes from Jos were about handling of LFN, but
appearently 2.0 is no longer available? Not sure about that, actually.

Anyway, I'm glad I got Okami, it works great and Newsie only does a job
here for online reading. No problems with that either, version 0.92

No. IIRC only the TT and Falcon have sockets for the FPU.

Even then the application needs to be programmed to recognise the FPU
and use it (rather than the s/w FP routines).

>
> Any ideas what I'm doing wrong?

Windows doesn't recognize the Atari partition format. You can create
media with a single partition that is both TOS and DOS compatible with
HDDRIVER. In this case no additional software is required to exchange
data between Windows and TOS. Or you install MagiC, FreeMiNT or Big-DOS
on your Atari. In this case you can use purely DOS compatible partitions
if an appropriate hard disk driver like HDDRIVER is installed. For more
information refer to the demo version of HDDRIVER:
http://acp5.chemie.uni-kl.de/seimet/atari_english.html

This message is to make you aware of the "ST News Lamentation Page", a
site where the life and times of the Atari ST/TT/Falcon multi-media
disk magazine "ST News" (1986-1996) are dwelled upon. It's located at
"http://stnews.atari.org".

The site boasts the most complete gathering of "ST News"-related
information, including an Ultimate Reference Guide, a download section
where all 42 issues of "ST News" ever unleashed on mankind can be
found, a gallery of pictures (including ones of quite a few people in
the 'Atari scene') and a link to the "ST News International Christmas
Coding Convention 2000" organisation and information site. To round it
off, the site is littered with links to over 200 sites somehow related
to "ST News" or the 'Atari Scene' in general.

The "ST News Lamentation Pages" are a huge success and have been
visited almost 14,000 times since their inception in May 1998. Come
visit to see how alive and kicking the Atari still is!

>
>http://www3.bc.sympatico.ca/roughley/monaco.htm

There was a lengthy discussion in a Dutch discussion group about it that
problably inspired Ronald to start the thread. But, as one of the most
knowledgeable readers got so upset about the level of competence of his
fellow readers, the discussion became somewhat awkward to continue.
He also felt that the discussion was a well-meant attack on his baby [Okami]
and that made it even worse.

Let there be no doubt about it! Whatever discussion there was,
how subtle the words were,
no one ever doubted the integrity of the programme nor his author.

What is sorely missed in programmes like NEWSie is the option to tell
the programme to add "charset=ISO-8859-2" [or any other known codepage]
to the mesage-header. Are you listening John ??
There's is NO character mapping necessary. When I see NEWsie of MS driven
Polish messages coming in, the "ogonki" are there, on the right spot.
No conversion needed. It's just the typeface that I may be missing to make
it look like real Polish.

Should the message have "ISO-8859-1" in its header - and I think NEWSie should
give us to add that one too - than Neil's suggestion for a Latin 1 Monaco font
is one to follow...

Greetings, Rein

It specifies actions the mailer will take dependent on the contents of
the mail-header fields.

For instance, you could set it up so that any mail containing 'rcain'
in the 'From:' field was binned!

... or you could sort incoming mail into different 'In-Boxes' which
is rather more constructive :-)

> characters placed according to the ISO, where is re-mapping done for
> what?

If you use an ISO 8859-1 font, then there's no need for remapping. But because the upper half of the Atari character set is non-standard, a newsreader has to interpret what's coming in or going out and shuffle these character values around accordingly. An example is the pound symbol (ï¿½): with the Atari set, this character's value is 156; ISO 8859-1 uses 163. So, a newsreader like Okami will do internal remapping so that the character can be interpreted correctly using the Atari set.

> I do not think it is a question of character remapping: it is: using
> the right font. Maybe that ISO-compatible font is made with a
> mappingtable from another font but that is a font-technology problem
> (maybe something for NVDI to do?)

The defacto standard for the Internet is ISO 8859-1. Yes, for some ISO standards, the operating system and client must be able to summon different fonts. The Mac, for instance, uses something called Text Encodings (Cyrillic, Hebrew, Greek, Thai, etc.).

About 180UKP or so for a Palm III. However, "everybody" is selling their
III's to finance the Palm V (smaller, sleeker, better screen but otherwise
very similar to the III) so you can get very good deals on second-hand
Palm III's nowadays.

>So that means: everybody in Europe (except UK) should make messages
>with ISO?

Nope. Everybody everywhere including UK and US should be using ISO. That way
when you write a message with your mailer/newsreader the receiving program
can map characters appropriately.

>And how do I do that with newsie, AMail QED Everest etc?

You don't. The editor can use whatever character set you normally use (eg
standard Atari), the mailer/newsreader does the mapping. NEWSie doesn't,
don't know about aMail.

>Something to do with NVDI?

Nope. Something to do with your mailer/newsreader. So far only Okami for
Atari (unless ASH emailer does it properly - unlikely as it can't get line
wrapping right).

>Ok then I should switch to Okami. Planned that long ago but...
>I look at the manual and cannot fimn info about using those ISO's. Or
>am I not good looking?

Edit the appropriate sections in O.INF (umlaut transformation and character
set). These sections are commented.

>And does your remark 'only Okami' that all newsread and write stuff
>for Atari is outdated?

"Unsophistcated in this respect" is closer. With no standard encoding you
can only *reliably* send to other Atari users in English. Once you start
having accented characters etc things start to become unreliable.
```

>Or not International?

Precisely: not international. Possibly as this isn't much of an issue for English-language use.

>Can go down the drain?
>May land in the gutter?

May develop ISO support over time? Who can say... it depends on the authors of the software.

>And what about CAB.
>That piece of software is also trash? Does not manage to do anything
>with ISO-tags on HTML-pages as far as I know.

Options menu, Font preferences dialog, Mapping ISO->Atari checkbox. This is in CAB 2.5.

I've had problems with MagiC/VFAT. A partition (not the Newsie one) got
itself well screwed up and only some of the files could be read, folders
couldn't be opened,and others could not be deleted, it told me it had
5Gb in several folders, on a 350Mb hard drive!

STTools couldn't access the partition, KNifeST didn't want to know and
Optimiser listed loads of problems in the Log files.

I had to reformat it and start again. The same thing happened a week
later so before reformatting again I just deleted VFAT and rebooted to
see what would happen. Everything was back to normal. All the files were
unscrambled and everything worked perfectly, no 5Gb mysteries and
Optimiser showed no Log file problems.

Incidentally, so far, Newsie 0.94 has been completely stable, no log
file problems, nothing.

Hello,

At the past Neus-Messe I've bought me a PCI Mach 64 4MB graphic card for my Hades. As driver I got novaVDI v2.62. I wonder if there exist a newer version of the novaVDI for the PCI Mach 64 card. If so where can I find it?

TIA
Martin

Someone once wrote:
>>I love my Atari because.....
~^~^~^

Needing a multisync monitor to get all three resolutions in one box. As well as the colour limitations (done to keep all the image files down to 32K in size) in the different resolutions. They should have allowed the programmers to choose if they wanted to sacrifice RAM for a colour depth. Very short sighted thinking here.

The composite video on the ST (if you're lucky enough to have Composite video on your ST) isn't broadcast quality.

MIDI THRU port incorporated in a non-standard way in the MIDI OUT port. Would an extra 5-DIN socket really have increased the price that much?

The idiotic placement of the joystick/mouse ports on the underside of the keyboard and (even more stupidly) on the detachable keyboard on the Mega ST models. Why? Why? Why? What moronic idiot thought this was a good idea.

The mushy, weak keyboard on the ST.

The fact that there is a lot of things the ST could do, but the damn software doesn't exist to do it. It's an even bigger kick in the crotch when the software to do it is available on the Amiga. I hate anything that gives Amiga users another thing to be smug about. (Where is my KiSS viewer/creator for the ST god damnit!)

Falcon/TT users who, when you ask for help finding software to do something on a lowly ST say "Buy a Falcon/TT." I will buy a Falcon/TT when I find one for the same price as I find Atari STs ($10-$20). I've got a PC and I can find the software to do anything I want on it. The whole reason I'm asking for the software on the ST is because I want to run that task on one of my STs, if I wanted to do it on another computer I'd do it on my damn PC.

Holier-than-thou users who when you even hint that you use "one-eyed" software freak out on you saying "Even though the product is discontinued pirating it is wrong. You're stealing money out of the pockets of the developers. If you're going to use the software buy a used copy of it." Here's a newsflash guys: if the software is discontinued, no more money is going into anyone's pockets and if you buy a used copy you're still not putting money in the pockets of the developers. Mellow out, the pirates are almost the only ones still supporting the ST anymore.

The way our devotion to the Atari ST attracts flamers and trolls who like to come on this newsgroup and say "You guys are losers! Buy a PC/Mac etc." It's even more annoying when the trolls are people saying we should get Amigas or Falcons.

People who seem to only use their Atari to run an alternative operating system so that they can flame people who run a different alternative operating system on their Atari.

Having one of your messages about the ST completely buried under a flood of the above mentioned OS-War posts.

People who are unneccesarily rude to newbies who ask a question like
"How do I hook up a hard drive to my ST?". There's no need to post back
"Read the f*ck*ng Quick FAQ you newbie lamer." If they're newbies then
they likely don't even know the Quick FAQ exists, it's not like they're
psychic or something. I know it's annoying to see 100 posts asking the
same old questions, but there's no reason to be rude about it.

That's so, it did give me a crawly feeling at first! ;-))

I have to say tho' that NEWSie is still my first choice. I enjoyed
(well perhaps that's too strong a word ;-)) my attempts to get Okami to run,
and TBH I was delighted to find that I could, but I really prefer NEWSie's
(and FireNews) interfaces, tho' both have their strong and weak points I know.

I have an old Akai S900, which was the previous model to the S1000. The S900
had no disk interface, you had to buy it as an add on part (like the ST host
adapters). AFAIR, the Akai S900 needed an Atari to format the hard disks
before they could be used.

Now, back to the S1000, does it have a disk interface like the ST (19 pin DMA)
or does it have a SCSI port. If it has the SCSI port, you might try
partitioning the hard disk on an ST, then connect it to the Akai.
I guess you could divide the disk into partitions of 256MBytes max.

You might have to make one of the partitions bootable (guess).

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with NewsGroups.

I've been working hard on adding more Atari stock to my inventory. I
wanted to have everything in place by April 15th for those of you with
Tax refund checks. Still, I've done pretty well. And I'm expecting more
to show up and add more to my inventory. So keep checking my website at
either http://www.teleport.com/~bensmith/bscomputers.shtml or
http://www.atari.benjamin.net

<h3>Click for WebSite!</h3>

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-
Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at
http://www.atari.benjamin.net And Jump to my FTP site linked to my Web
Site so you can Download Free Catalogs or FTP directly to my site at:
ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way,
Feel free to Request catalogs through E-Mail. Really, it's not an
inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both!
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail.
Please let me know if I can attach text files to your E-Mail. Catalogs
are just regular ASCII text files so you can download them into your
text editor and view them, edit them or print them out! It would make
things easier for me if you take my Catalogs, load them into your text
editor, delete what you don't want and E-Mail me the rest! To expedite
things, include your complete Mailing address so I can figure your
Shipping/Postage & Handling. I'll be back after the weekend.

> I remember others mentioning problems if your RAM isn't up to snuff. I
> upgraded my Falcon long ago with a 16 meg SIMM, but I don't recall the exact
> type or speed of it. What RAM type, speed, etc. is recommended for trouble
> free NEMESIS performance? And, is it still readily available?

If i have my nemesis machine, i also used a 16 (14) Mb Simm Ram-Board.
That doasnï¿½t work correctly first time, later i changed the Simm from
70nS to 60nS. That was better, but not perfekt. The guy how take this
machine replace the board with a original atari memory board and the
machine works fine in nemesis high.

If you see flickering points, stripes on display, ram isnï¿½t good..

> Does the NEMESIS upgrade actually eliminate the Falcon SCSI bug (where the
> drive will momentarily freeze up for a minute, then resume it's access -
> normally under 256 or greater colors)?

Yes. The buffer board work perfectly (also without nemesis) If you fit
this circuit, all scsi problems are eleminated.

> Will the NEMESIS increase the useable serial port speed on the Falcon? I
> can't seem to get anything higher than 57,600 on mine now (with HSMODEM).

I think no. You have MagiC? Same as here... 57K6, not more.
Allways CRC-Errors while using 115K2, nemesis doasnï¿½t fix that.
Better chance for 115K2 without MagiC.

> Is there anything else I should know or check or have done when getting the
> NEMESIS installed? Basically, I want to make sure the job is done right the
> first time so I don't have problems later. I don't want to overlook anything.

Yes, if i made the first one i need a half day to got it running.
But if it works, it is fast.

Watch exactly the manual, place ot resistors, urgend place is L102, and
the resistor R23x (i canï¿½t remember me exactly) have to read DOITF30
again :-)

Bad thing is the wrong description of one wire in older manuals..
I think the brown/yellow wire was wrong.. -> DOITF030

Some people doasnï¿½t found the right track (DSP clock) nearly the DSP,
they all cut the wrong track..

Also the same with the track below COMBEL chip..
If thatï¿½s wrong, machine doasnï¿½t work well.
Video modification, the next point...

Someone only got a wild flickering display..
I correct the video modification and it works.
(Same as with CT2, nobody read the manual up to the end) :->

Cut ACIA Pins only if you have the right tool..
(Maybee all other damages the mainboard)
(Damage on smal tracks near the pins..)

OK, hope that helps
Nemesis was fine, but it is nothing for people they have problems to
find the right solder points on mainboard. Itï¿½s easy for people they
fit some expansions often. (What a english, sorry, doasnï¿½t found the
right words.)

Regards, Robert

> > Any suggestion and current used prices ?
> > Thanks

If you need just one extra MIDI IN/OUT port and if one your sound
modules has a "to-host" port you can use the LAN port of your Falcon.
All you are going to need is a standard Macintosh cable with mini-din
8-pin on both sides (about 10$) and a lanport.drv driver (by Steinberg).
If you need the driver, let me know.

On 15 Apr 1999 20:19:25 , Paul Nurminen wrote:
->Well, I aquired a NEMESIS board from a guy in Finland, and I'm getting ready
->to install the thing (or failing that, have Alex at ATY do it for me). I
->wanted to find out a few things from those of you who have NEMESIS installed
->in their Falcons.

Unless you have pretty good soldering skils/patience, I'd recommend having
Alex do it.. ;-)

->I remember others mentioning problems if your RAM isn't up to snuff. I
->upgraded my Falcon long ago with a 16 meg SIMM, but I don't recall the exact
->type or speed of it. What RAM type, speed, etc. is recommended for trouble
->free NEMESIS performance? And, is it still readily available?

There seems to be some diff. of opinion here, as I've had other Nemesis/
Falcon users tell me that what didn't work with mine, worked fine for
them (don't ya just love consistency?) <grin>.

Anyways, on my setup, it needs a Ram board that uses a single 72 pin, 16
meg SIMM rated at 60ns, and shielded (Panasonic SIMMs are, AFAIK-but I
don't know about others). I could NOT get the Chro-Magic Ram board to
work, no matter how fast I made the SIMMs.

->Does the NEMESIS upgrade actually eliminate the Falcon SCSI bug (where the
->drive will momentarily freeze up for a minute, then resume it's access -
->normally under 256 or greater colors)?

I believe it does, as well as some other problems (timing, I think). Its
in the Nemesis manual...

->Will the NEMESIS increase the useable serial port speed on the Falcon? I
->can't seem to get anything higher than 57,600 on mine now (with HSMODEM).

Don't know about that, but it will increase your IDE hard drives through-
put by a considerable margin.

Good luck, and don't hesitate to ask if you have problems! ;-)

947. XBIOS(4) Bug with graphic card

Newsgroup: comp.sys.atari.st
Date: 1999-04-16 00:00:00 UTC
From: sony@ciril.fr
Message-ID: <7f7erkeko1@arcturus.ciril.fr>
Source record: 80664

E-mail emond@inrs.fr

With a VME graphic card NOVA on TT, the XBIOS(4) function (GetRez) always returns 2, equivalent to 'ST high resolution' whatever is graphic card resolution.
As a consequence, a lot of programs who run correctly on TT without graphic card, in ST low resolution or TT Medium resolution cannot run with graphic card in the same resolution (for exemple 320x200 16 colors for ST low).
Does someone know a tip to avoid this problem ?

Thank's for reply.

Well, there isn't really anything very sensible it could return in the
general case. Or is there?

>As a consequence, a lot of programs who run correctly on TT without graphic
>card, in ST low resolution or TT Medium resolution cannot run with graphic

What programs are that? I'm very interested for reasons stated below.

>card in the same resolution (for exemple 320x200 16 colors for ST low).

Are there graphics cards that can give that resolution?

>Does someone know a tip to avoid this problem ?

Tell the programmer to fix his program. ;-)

Seriously, far too many programs use the XBIOS to find out the screen
mode and/or screen address, even when they are going to use the VDI!

This has lately been causing me some headaches when trying to make
those programs run on the Eclipse/RageII using fVDI.

There should be no reason to expect the XBIOS to know what the VDI is
up to. Some graphics cards may not even have directly accessible memory
(that is currently the case with the Eclipse/RageII, but an MMU hack
will hopefully take care of that (though it may not work with all
possible operating systems)), and even when it's accessible the data
there may not necessarily be in the same format as what you're supposed
to send via the VDI blit functions (also the case with the
Eclipse/RageII under fVDI (at least for the moment)).

Ok, I bought the thing 2 days ago, but I can tell you what I DO know.
The S1000 have a scsi interface, and those were options to the S1000.
They have 50pin Centronics connector.
There are 2 reasons why I'm here in this group.
1. There is no *akai* or *sample* group, atleast not on my ISP.
2. When I booted the S1000 and tried to access the harddisk it asked for the
Atari partition Number.
That led me here. :)
The internal format-feature let you choose between 30 and 60 MB (atari) partitions.
I don't think you boot anything from the harddisk, Since the OS is in a flashROM.
Maybe I should try to find someone with a ST. I used to have one, but that was
years ago. Is there anyone here that lives in Gï¿½teborg, Sweden, that wanna help? :)

Thanks for your help.
I'll keep you posted.

Mathias

> I've just bought an used Akai S1000 (it's a sampler).

I don'y know about the S1000, but the S950 needed its own partition and formatting, so, don't expect to use directly atari formatted hard disk and or partitionned ... the S950 needed an interface to use proprietary atari hard disks like the Megafile series ...
For the moment I use one Quantum hard disk on the S950 interface but I needed to use the formatting option inside the S950 ... so let's have a look at disk options in your S1000 and I suppose you'll find the same option somewhere ...

Some bad news, that upgrade chip is no longer available. After much dialoge with soundpool it turned out the only solution was to do a board exchange. I just got mine back this week, the total round trip was almost 6 weeks from OR. US by post. The cost was $100 to Soundpool for the board and mailing and about $12 for my mailing cost.- caio - daniel In article <37040252.5A87514F@earthlink.net>, Particle Salad <psalad@earthlink.net> wrote:

> I love my Atari because.....

1. Nostalgia
2. Free programs on the internet and ftp sites
3. Ease of use
4. Lots of really fun games!
5. Most hardware and software is dirt cheap nowadays!
6. Dependability
7. Still very useful for word processing, art, music, email, internet, newsgroups
8. It's not popular.
9. It's a humble machine that one can grow attached to.
10. Most programs are very small and run quickly.
11. There's a lot of support available, especially right here in these newsgroups.
12. It can use new hardware of all kinds.
13. I just do!

957. Falcon/SVGA Screen resolutions

Newsgroup: comp.sys.atari.st
Date: 1999-04-16 00:00:00 UTC
From: tparrett@fast.co.za
Message-ID: <924283829.775981@news.netactive.co.za>
Source record: 80674

I'm sure I have read that it is possible to obtain screen resolutions beyond the std SVGA 640*480 by fitting a graphics card. Am I correct ? If so does anyone have the details of such a card re supplier/price/ in case or out of case fitting/ plug in or solder etc.
I have tried both Videl and Videlity without any success at all despite the fact that my 14" Philips monitor supposedly has a std resolution of 800*600.Looking through some of my old mags I found a review of Screeblaster 2 but noted it used one of the paddle ports. I have the Log3 dongle permanently plugged in to the cartridge port and that covers up bothe the paddle ports so even if that is still available it wont be of use.
Any ideas ??
Thanks

>
> So what all can you do with it now?

All of the standard tools in pilot-link works, so I can do anything a linux-user can. I have modified pilot-mail slightly so it communicates directly with aMail, but the plan is to add a GEM-interface and support for ASH Emailer and NEWSie.

Together with Geir Oyvind Vaelidalo I'm also planning to write a simple GEM-interface for pilot-xfer (install/delete/backup everything on the Pilot), and we're also planning on developing stuff like an address-book, memopad etc. to work with the Pilot. Nothing fancy though, we don't have time for that. But for now the most important thing is to get the aMail/Emailer/NEWSie conduit ready for release. So far I haven't been able to get it working under MagiC, but Geir refuses to switch to MiNT so we just have to solve it ;-)

Btw. if there are other Atari/Pilot users out there, please contact me. I'd like to hear from you what you expect from Pilot-software on the Atari.

I will surely try it but I doubt it.
The strange thing of it all is: when the Syquest contains a 44 Mb
disk the the CD is not seen.
When there is no disk in that drive the CD is seen.
Electrically nothing changes on the SCSI-bus.
Or???

>
>You need a newsreader supporting ISO-8859-X standards.
>The only one for Atari is OKAMI. It is one of the reasons I love this
>programm.

Ok then I should switch to Okami. Planned that long ago but...
I look at the manual and cannot fimn info about using those ISO's. Or
am I not good looking?

And does your remark 'only Okami' that all newsread and write stuff
for Atari is outdated? Or not International? Can go down the drain?
May land in the gutter?

And what about CAB.
That piece of software is also trash? Does not manage to do anything
with ISO-tags on HTML-pages as far as I know.

Please help!!!

Thank you for clearing up this point. I will give this a try. But
before I start downloading I have a question:
'Character remapping'
When a message should come in tagged with ISO the reader should know
what to do then. If I use in the window a font with
characters placed according to the ISO, where is re-mapping done for
what?

I do not think it is a question of character remapping: it is: using
the right font. Maybe that ISO-compatible font is made with a
mappingtable from another font but that is a font-technology problem
(maybe something for NVDI to do?)

And I have still the problem with Russian chars (is another ISO)

>>I love my Atari because.................
>>
>>
Well, maybe I should add some lines here too...

Lately I've been assigned to the IT/automation dept. at my work,
freelancing at times at my own convenience.

Installing Win-95 machines into a network, configuring them, installing
S/W etc. One day you do the exact same installation according to an
installation protocol on machine #4 and it runs into trouble, where
installations nrs 1, 2 and 3 on exactly the same machines previously had
no trouble at all...

I experienced no crashes, but the logic of Win-95 still escapes me.

Stupid hardware conflicts, one day they show up, the next day they don't.
Netware servers that run into trouble for no reason at all. Workstations
that report "printer out of paper" or "not located" for no reason at all.
Machines crashing for no reason at all.

I *am* glad I've got this bloody old TOSbox at home.

BTW, I've still got 14 machines to go...:-(((((((((, then come the 15 old
ones to upgrade from DOS/Win 3.11 to Win-95 and hook into the network...

BTW-2: don't you just love service companies, that return a P-166 as
"serviced", then you hook it up and it won't work, so you open the case
and the flatcable to the floppydrive is just hanging loose and one plug of
the PSU is doing the same, not connected?

Just wond'ring: is THAT PC-world????????????

> I'm sure I have read that it is possible to obtain screen resolutions
> beyond the std SVGA 640*480 by fitting a graphics card. Am I correct ?

Sort of! You don't actually need a graphics card - all you have to do
is increase the speed of the video clock.

I use BlowUp, which adds a new oscillator. You can switch this
between the original speed and two higher ones. My default mode is
880x640 in 16 colours, 72Hz refresh. I've also got a 1024x768 mono
mode defined, and you can also get 480x480 in True Colour.

But yes, you do need a graphics card for a "serious" solution. I'm
not sure of any that are available! However, Titan are about to
release a plug-in board called Eclipse that allows any PC-style
graphics card to be used - specifically you'll be able to buy it with
the ATI Charger card which gives unreal resolutions!

Source record: 80694

Hi,

> 1. TOS 4.01 vs 4.04, I've heard 4.01 is to be avoided as it's buggy,
> suppliers/cost of upgrade in UK?

4.01 has a lethel bug in the harddisk handling that was fixed in 4.02
and later.
If you fill up your C: drive, the FAT of your D: drive will be
overwritten - not funny at all!
I don't know of other bug fixes in the TOSes, but there are surely
something else...

> 2. The Falcon has a SCSI-2 and an IDE interface, so can I bung any old
> SCSI drive on the back and any old IDE drive inside? Any other issues
> relating to drives, maximum size? Is HDDriver a must?

Most SCSI-drives work, but there are problems with some - take a look at
my site for a small list of HD's that are compatible with CAF...
Most IDE's will work too - but again, there are quite a few that don't
:(
I would definitely recommend HDDriver since it's the best and fastest
driver - and it's updated most frequently among the ones that still are
updated.

> 3. Will Cubase (other than CAF) work on Falcon?

Cubase Score will definitely work and 3.02, but I believe 3.0 didn't
work - not sure about 3.01.

> 4. Falcon happy with any VGA monitor, I mean any? Are all resolution
> modes accessible with a VGA, ie ST hi-res?

Of course, you need the VGA adapter, but with it, you should be able to
use any VGA or SVGA monitor. There are a couple of resolutions that
don't work, but they're RGB modes and they're not available if you have
the VGA adapter inserted.

> 6. Anyone know of a free/shareware audio multitracker that can be midi
> synced/slaved to my STe?

Why use two computers when you can have everything in the Falcon? It's
much more convenient to use CAF...

Best regards,

I used Okami on Magic on a VFAT partition and had no problems with it.
Then again, I had v1.35b, which fixed the problem Okami had with LFNs
with Magic. I don't know if it's possible to find v1.35b, but I know it
works very well with Magic.

1. It is So different then Win 95/98!
2. Built in Midi Ports and unique midi software.
3. Easy to use interface; the best of both worlds (mac/PC)
It can read dos based discs yet has the feel (or better then) a mac.
4.Missile Command!
I could go on and on ...BUT ...give someone else a hack!

Hi.

I don't know whether this is the right forum for this question, but
I've just bought an used Akai S1000 (it's a sampler).
It is suppose to use Atari-scsi partitioning, that is why I ask you guys. :)

How does "atari-scsi" work? Is there a FAQ on the subject?
I'm trying to get my old Seagate ST1489N to work with it, but it doesn't
spinn up. There are LOTS of jumpers on that old disk, maybe a combination
there might do the trick.

Every small piece of information is useful.
Thanks in advance.

Mathias

Is Applicat purely for use with MagxDesk - I use Thing, and shortly Jinnee.

Meanwhile the tip about TOS2GEM works for Okami's use of TTPs, but my CiX
OLR still runs arc.ttp on a ghastly TOS white screen.

> I have tried both Videl and Videlity without any success at all despite
> the fact that my 14" Philips monitor supposedly has a std resolution of
> 800*600.

You can get 800x608 non-interlaced in 16 or 256 colours on standard
Falcon without any hardware extensions. Just the matter of using and
configuring a software screen expander like Videlity or Videl Inside you
already mentioned.

The only disadvantage is that in 800x608 the vertical screen sync
(i.e. the refresh rate) goes very low, i.e. it is about or slightly
more than 50 Hz.

Some day one of my friends, Amiga user, has bought an Atari 1040STE.
This STE was good equipped, it has TOS 2.06, 1.44 MB floppy, a hard
drive and 4 MB of RAM. Also, with the computer he has got a bunch of
software on floppies. The computer was in an excellent condition and
(as we proved at service) 100% okay considering the hardware.

I was asked to help him installing all that since he haven't had any
clue.

I've configured the TOS, but when I looked at the application software
to install, I found MagiC 5.something. Well, I think then, why not: if
this beast is supposed to work stable on anything except Falcons,...
saying truth, I was also curious personally to see a legendary MagiC
stability.

So I have installed MagiC on that computer. It rebooted OK, then MagiC
desktop has appeared. So I setup icons and all that stuff we do to
configure desktop, then selected "Arbeit sichern" from the menu. It
crashed at that very moment. Id est, it behaved like it used to on most
Falcons.

This experience makes me think that aforementioned operating system is
crap and there's nothing really Falcon related. I've seen a lot of wise
sayings here like "some Falcons have been made Monday morning" and
"Atari did something strange in Falcons" etc. However, I personally
think it's pure bullshit: how come everything can run stable on Falcons
(everything = Linux/m68k, NetBSD, MiNT, TOS finally), just MagiC cannot?
Isn't it just MagiC where strange things are done or that is assembled
Monday morning?

PS.1. No, I've never applied MagiC to my TT.
PS.2. That STE is running MiNT as a secondary OS now (primary is TOS
2.06).

Source record: 80561

On Fri 16-04-1999 18:07 (GMT) Stichting ST wrote:

>So that means: everybody in Europe (except UK) should make messages
>with ISO?

If someone wants to use 8-bit characters (i.e. with codes > 127), he
should use ISO standard. For Western Europe (and for UK also - because
of the Pound sign) it is ISO-8859-1. For most news/mail readers ISO-
8859-1 is default.
When using only 7-bit character a message header can define:
charset=us-ascii
or not to define characterset at all.
The most competent in this matter is Jos den Bekker.

>And how do I do that with newsie, AMail QED Everest etc?

I can describe what I was doing when using NEWSie.
I prepared a special font and a special keyboard layout, both according
to the ISO-8859-2 standard.
Having this, it was no problem to read/write messages in ISO standard.
When editing new message I kept to insert in the first line of message
the following line:
Content-Type: text/plain; charset=ISO-8859-2
and to leave the next line empty.
Messages prepared in this way were recognised and decoded correctly by
other mail/news readers.
You can do this same for ISO-8859-1.

>I look at the manual and cannot fimn info about using those ISO's. Or
>am I not good looking?

Check O.INF file - comments include all this informations.

>
>And does your remark 'only Okami' that all newsread and write stuff
>for Atari is outdated? Or not International? Can go down the drain?
>May land in the gutter?

No! Simply, no one (except Polish users) asked for this!
On the John Rojewski's "To Do" list, implementing an ISO standard is
far from the top:(

>And what about CAB.
>That piece of software is also trash? Does not manage to do anything
>with ISO-tags on HTML-pages as far as I know.

It is possible to prepare a special SPDCHAR.MAP file for remaping
characters (as we do). Ask Rain how to make this ;)

> idea....) what does java accomplish?

I sometimes wonder that. I'm learning Javascript currently (not easy considering I'm a Falcon owner!), and use net resources to find some examples of Javascript. Most archives of example scripts have a lot of onmouseover image change effects, but few real clever scripts. I also find some good scripts like ones that check validity of data entered into webpage forms etc...

Hi Rob. Not to be too picky about this, but is there any way to by-pass the
java thing? that way the chat is restricted to those who have access
to other computers. It is perfectly possible to set up a chat
without java, like the AUNT chat that can be used with CAB.

Regards...

Daniel

I'll describe this to the best I can:

I have an STE that has the standard 4 SIMM sockets. 2 of the slots are filled with the standard 520 configuration.

In the other 2 (other memory bank) is 2 SIMM like boards that lead to another circuit board that has 2 1 meg SIMM's solder directly to the board and 2 empty SIMM sockets!!!

This gives 2.5 meg of memory! What is it?

There is no clues on the board, and it is of a commercial quality.

Notator definitely works with it. It's basically the first port on C-Lab's old "export" device, which gave 3 extra outputs. No drivers needed.

Cheers,

Xav

I never used VFAT on my Atari/MagiC. ISTR that the early implementation (in MagiC4) was supposedly a bit iffy, but it's better in later versions. No problems yet with it using MagiC-PC, but then Windoze is quite capable of messing up your hard drive without any extra help...

>STTools couldn't access the partition, KNifeST didn't want to know and
>Optimiser listed loads of problems in the Log files.

I'm unfamiliar with Optimiser, but know for sure that STTools (unless there has been a recent update) and KnifeST don't understand VFAT and will most likely make matters worse if used on a VFAT partition.

>Incidentally, so far, Newsie 0.94 has been completely stable, no log
>file problems, nothing.

Hopefully that problem with the earlier versions has been fixed, then.

BTW the Okami/VFAT thing was nothing to do with drive corruption, just something to do with how Okami operated when it detected a filing system with long filenames: whatever it did worked with MinixFS under MiNT, but not VFAT under MagiC.

The two are quite different: MinixFS for example is truly case sensitive (as with most Unix filesystems), so file.txt is different to FILE.TXT. VFAT is case *preserving*, so it knows if you've used file.txt or FILE.TXT, but they are regarded as identical filenames.

Whether this is anything to do with Okami's problem isn't clear, but as someone pointed out it has been fixed in later versions.

It's important to realise that Java and JavaScript are two separate things with (unfortunately) similar names. JavaScript is a scripting language, usually interpreted by the browser, and does the kind of thing mentioned above. Java is a full-blown programming language for writing programs which run in the Java Virtual Machine - even big packages like Word Perfect.

AIUI the JVM is *supposed* to be a secure environment (the Java "sandbox" in which the programs play...), in that the programs are supposed to have no direct access to external resources such as your hard drive etc. Wouldn't surprise me if it turned out to be full of security holes, though.

The idea of *Java* is that you can write applications which are platform independent, so as long as you have a JVM on your computer you can run the same code as someone using a JVM on another machine. So, for example, the Java Word Perfect should work on Windows, Mac, Unix etc. The only reason why it won't work on Atari is that there isn't a full JVM available (I believe that the one that has been ported is missing some of the bits needed for a GUI).

This of course is why Micro$lop has been trying like mad to make Java use Windows proprietary extensions, as platform-independent code is anathema to Mr Gates. They tried the same trick with JavaScript, too, by promoting VBscript and ActiveX (which only work with Windows), fortunately without succeeding so far.

I agree about gratuitous rudeness to newbies (and freely admit I've flown off the handle before now, something of which I'm not proud), but there is an element of personal responsibility involved in ignoring basic netiquette. Just about every internet primer worth its salt and all the useful docs posted to news.announce.newusers make it clear that it's good manners to lurk in a newsgroup for about a fortnight before posting. Partly to get a feel for what's acceptable to the existing users and partly because most FAQs (and often charters, too) are posted regularly (weekly or fortnightly) so you'd receive it in that time window. We don't have a regular FAQ posting here, but anyone subscribing and reading for more than a couple of days should pick up on the existence of the quick FAQ and how to get hold of it.

I get the general impression that a lot of the repeated FAQs come from people who ignore this basic advice or (worse IMHO) don't even read the group - hence requests for email responses. In which case I'm of the opinion that a quick response of "go and read the FAQ" is appropriate. Similarly short shrift should also be given to unnecessary multiple postings, something else clearly advised against in any netiquette guide.

So newbies aren't psychic, but often they have good advice available and choose to ignore it.

If they follow the guidelines (which their ISP should have told them about, either in their signup information, their web guides for new users or at a minimum by automatically subscribing new users to news.announce.newusers), by the time they start posting they will know about how not to antagonise other users and how to get the FAQ.

I've had a Freeserve account for some time now, and have had no problems with it until the middle of this week when STinG refused to initialise about 90% of the time. A friend of mine with a Freeserve account and STinG also has had similar problems :-(Maybe it's a problem with Freeserve?

I've also had problems over the last few days accessing web pages through Freeserve - a lot of server errors are coming up, although things seemed a bit better today :-/

Cheers,

Ashley

>I'm sure I have read that it is possible to obtain screen resolutions
>beyond the std SVGA 640*480 by fitting a graphics card. Am I correct ? If

Yes it ist possible.
ScreenBlaster internal or external module
NOVA-Board (realy expensiv) only as used unit avaiable (I think so)
Titan Design..

Use CT2 acellerator with 928x608x256 in this moment on my machine.

SreenBlaster is the easy to use one, not expensiv, hart to get.

>so does anyone have the details of such a card re supplier/price/ in case
>or out of case fitting/ plug in or solder etc.

NOVA Boad -> Plug In (Falcon internal expansions port) (expensiv!)
ScreenBlaster internal, 4 Solderpoints, one on SMT Videl chip.
ScreenBlaster external, plug in. Monitorport an one of the paddle ports.
Titan -> no informations, try the Titan WebPage
All other hardare based video blasters.. -> soldering, Falcon internal.
BlowUp..
FX-Board.. (accelerator, screen- memory expansion on one board)

>I have tried both Videl and Videlity without any success at all despite
>the fact that my 14" Philips monitor supposedly has a std resolution of
>800*600.Looking through some of my old mags I found a review of

Used display must handle higher resolutions and frequencys.

>Screeblaster 2 but noted it used one of the paddle ports. I have the Log3
>dongle permanently plugged in to the cartridge port and that covers up
>bothe the paddle ports so even if that is still available it wont be of

So you need the internal version ;-)
(Can't say how you can get this expansion) (Take a used unit)?

Hope that helps

Hi Daniel,

On the Delphi chat... I believe they do have an non java version
(JOE,DANA????), But I think you need CAB 2.7 at least, because the site
uses "cookies" and 2.7 is the only version that supports it.
Let me find out a little more info and I'll post it here...

1016. atari stuff to trade

Newsgroup: comp.sys.atari.st
Date: 1999-04-17 00:00:00 UTC
From: ethh@enemy.org
Message-ID: <7fa2qh$j3s$1@news1.skynet.be>
Source record: 80589

i'm willing to trade atari stuff for atari stuff.

at the end of the list, there is some other non-atari stuff to swap as well but i'm only interested in atari stuff, don't propose other stuff or money.

i'm in belgium so consider the postal costs accordingly.

tags: games title have tags. these are: "b" to say it comes with the box; "d" to say it comes with the doc; "f" to say it has no value to me and that it is free to give away along with any other swap.

bargain by e-mail only.
===
i propose:

lynx games: shadow of the beast (bd), hard drivin' (bd), ishido (bd), viking child (bd).

jag games: kasumi ninja (bd), cybermorph (fd), blue lightning cd (fbd), vidgrid cd (fbd), myst cd, full version (bd).

a working jaguar without joypad, with alim, scart cable, av stereo cable (d).

n64 games: turok2, seeds of evil (bd), zelda ocarina of time (bd).

pc games (that work under plaindos): might & magic 4 (not the reedit) (bd), realms (bd), ultima vii + data disk (forges of virtue) (bd), ultima vii ii's data disk (serpent seed) (bd), shadowcaster (bd), arena the elder scrolls (bd), ultima viii pagan (bd), f-29 lightning ii (fbd), f-16 fighting falcon (game text in german) (bd), ultima underworld i (bd), ultima underworld ii (bd), flying corps (fbd), flames of freedom (bd).

pc joysticks: 2x quickshot v (2-buttons flight simulator stick with adjustable x&y sensitivity), and 1x gravis gamepad (with drivers).
===
i'm looking for:

a tt-ram card fully fonctionnal that can carry at least 8mb.

any lynx games, particularly: california games, slime world, ms pacman, asteroids/missile command.

any jag games, particularly: worms.

any st originals, particularly: dungeon master, starglider ii, superwonderboy in wonderland, ghost and goblins, ghouls & ghosts, elite, castle master 1&2, viking child, tower of babel.

mouses for atari.

in order to burn them and put the pictures on the destroy microsoft website,
free original microsoft products of high value with box and docs (you won't
ask for something in exchange for those).
===

Yes, some have this trouble, some not. I donï¿½t know why.
You also use HSModem7?
Sure, since CT2 i also used 115K2 on Modem2
Same as with a "naked" :) Falcon.

Another reason..........

At least with the ST you knew it crashed (when it crashed that is). Your not sat there wondering if it's crashed are taking a very long time to do something because it's so slow! Also it was an outright crash and not a gradual deteriation of the OS like with the PC. Also they weren't random like Louis has mentioned and I'm sure most of us have experienced.

Muscles

Be Strong..............

|The Guy's From A-ONE are usally around (And ME!!)...

Rob,

It's not JAVA that's required, but cookies. While there is a JAVA
applet that you can use to chat on Delphi, there is also a HTML
version that sort of work with CAB 2.7. Cookies are an absolute must
though.

I used CAB and the HTML chat software this past Tuesday evening to
chat for a while, but it drove me absolutely nuts. I prefer chats the
way God intended... in ASCII. <G>

I frequent the Delphi chats, but haven't made it around to any others
on the web. Maybe someday. :(

Take care,

Joe Mirando

Because it's a beta version. That's why I never have put it on the Belgian
ftp-site too.
AFAIK 1.35b was some kind of interim version between 1.34 and v2.0

Ah, thanks.

Why is Ulf releasing this? Has a disaster befallen Peter and/or the
STiNG home page? As far as I remember Ulf was in charge of the RESOLVE
module.

>to install the thing (or failing that, have Alex at ATY do it for me). I
>wanted to find out a few things from those of you who have NEMESIS installed
>in their Falcons.

I used to do the upgrades at Titan Designs when Nemesis was first released
so I suppose I could be considered an expert :)

>I remember others mentioning problems if your RAM isn't up to snuff. I
>upgraded my Falcon long ago with a 16 meg SIMM, but I don't recall the exact

This seemed to be mainly related to the memory upgrade board rather than
the actual memory. I found that standard Atari 4Meg boards were always
fine but 16Mb boards tend to cause problems.

FalconWing is a waste of space where Nemesis is concerned.
The Atari 16Mb boards which contain lots of soldered chips also cause
problems.

You should have an upgrade board which takes 1 72pin SIMM, the ones sold
by Titan are definitely best. The SIMM should be 60Ns.

>Does the NEMESIS upgrade actually eliminate the Falcon SCSI bug (where the
>drive will momentarily freeze up for a minute, then resume it's access -
>normally under 256 or greater colors)?

In most cases, yes. I upgraded one machine which locked up copying files
bigger than 1meg & this seemed to be some sort of problem with the SCSI
controller chip. After the chip was replaced everything worked fine.

>Will the NEMESIS increase the useable serial port speed on the Falcon? I
>can't seem to get anything higher than 57,600 on mine now (with HSMODEM).

I use 115200 on a regular basis with my modem and have used 153600 with no
problem via null modem (Falcon to Falcon)

>Is there anything else I should know or check or have done when getting the
>NEMESIS installed? Basically, I want to make sure the job is done right the
>first time so I don't have problems later. I don't want to overlook anything.

Do the bare minimum necessary to test the installation before adding all
the optional bits.

Install the board & ground the two switch lines first - this will let you
know that the board is working properly before you go cutting tracks
everywhere.

Then wire up the switch lines to the ACIA chips, cutting the requisite pins. Test the Falcon by running the switch programs. This will let you know that the oscillators are working.

Now do the DMA fix and test your drive at the highest speed as detailed in the manual.

At this point you should be able to install the DSP & FPU acceleration.

I wouldn't recommend the RGB mod if you don't use an RGB monitor - the tracks here are very fiddly & of course it necessitates drilling a hole in your case for switch mounting.

Above all, read the manual *AND* the readme file on the disk before doing anything. Make sure you mark the parts of the manual which need updated.

Good luck with the upgrade.

Well alright! I know that my gang would love to play around with your
new emulation engine. We even have a few programmers and hackers in
our group.
Since we tend to tinker with Atari emulation engines on both the PC,
Mac, and sometimes Atari platform... would this be a PC or Mac Falcon
engine?

Interested,

My guess is the original owner bought a 4 meg upgrade board but could only afford 2 meg worth. I remember those days.

I bought a new-life board for a Macintosh 128K... was only able to afford two simms and the other two were later populated. Of course, the other two slots went flakey and the computer was downgraded to a 2 meg machine till it finally found silicon heaven.
The dead carcas of my Macintosh 128 is buried somewhere in my living room. :)

Alright, I figure this question should be asked once in my Atari career in computerdom....

Got parts lying around... mainly from my Macintosh days. I see the inside of an Atari and then a Mac... a lot of similar pieces. What are the chances of salvaging parts off the Macintosh, getting parts from elsewhere, and building an Atari computer?

(Bracing for the barage of XM301s that will be thrown at me...)

I am an Atarian from the 8-bit days. To me there is no greater device to use for storing and constantly using a program than ram/rom based. No mechanical components to go out, nothing to lubricate... to me, it's heaven.

The only modern day equivalents that come close to the bliss of a cartridge is a flash-ram card (that I tend to use on a Newton) and of course rewritable CD ROM's are nice. (While the drive has mechanical parts, at least the CD platter will survive...)

So I'm curious... the Atari ST has a cartridge port that can handle a 128K cartridge (been into the ST scene for only five months tops). So far I've heard of a terminal cartridge and the Spectrum (Macintosh emulator) cartridge.

What else on the ST was/is cartridge based?

As a matter of fact, I just looked in on the Atari Advantage forum, and the new software/HTML is taking shape rather nicely. It seems like it's still being assembled to some degree, but the chat and message base links are there already. Just going to http://forums.delphi.com/atari will get you there so that you can check out what's available.

For what it's worth, I think the new setup is going to be really great.

How 'bout checking it out for yourself and letting the Forum Manager know what you think? By the way, I'm not a member of the AA forum team, just a long-time member. <g>

Take care,

Joe Mirando @ A-ONE Mag

Hello,

I installed the new STing 1.20 on my 14meg Falcon last night and
had no problems at all. I used my old DIAL.SCR, DEFAULT.CFG, and
ROUTE.TAB from the previous STinG 1.15 I was using. STinG 1.15
has been working great on my Falcon with either TOS or Geneva/NeoDesk
for along time. I never have any crashes or lockups due to STinG.

Not sure if there is any new options with the Dial.Scr and
Default.cfg in the new STinG v. 1.20.
I would like to know what the improvement are suppose to be
in the new STinG v. 1.20. I've not used it enough yet to make
any real claims on speed improvement. But while online last
night. I did notice a big increase in speed with CAB while
having AtarIRC running in the background using Geneva.
But it was late, maybe less traffic caused the increase. :)
Will know soon as I go along with it... ;)

Also, I have used STinG v.1.15 on my 4meg STe with Tos 1.62 and it
works great with it too. No crashes or lockups.

If you are having trouble with your STinG set up then you may need
to change something in the Dial.Scr or Default.Cfg. Or it could
be your settings with HSModem7. I used the default HSmodem7 setup
for my STe. Didn't change any settings at all for it.

However I did change the settings in HSModem7 for my Falcon.
Increased the buffers to 4096 and etc..
Setting up HSModem7 for the Falcon is a bit confusing. I'm still
not sure that I have it set for Maximum performance, I can't
go above 57600 for some reason and if using a larger resolution
like 1280 x 960 in 16 colors or 800 x 600 in 256 colors I have
to use 38400. But it is very Stable. No packets dropped or etc.
I've not tried anything above 38400 with STinG 1.20 yet, will do
so soon and see what happens.

Before I started using STinG I was using HSmodem7 on my Falcon with
Oasis 1.35E. And the Atari Modem.Cpx. If I am not mistaken the
Atari Modem.Cpx would only allow 19200. And to obtain higher baud
rate one had to use HSmodem7 to patch the modem.cpx and use the lower
baud settings to get something above 19200. This I'm fairly sure was
done on my Falcons HSmodem7 set up. Now when STinG came along it
had its own Serial.Cpx that replaced the Atari modem.cpx and would
allow higher baud rates than 19200.

When I installed STinG, I used the same HSmodem7 programs with it
that was setup for use with Oasis. Patched to allow higher baud rates
above 19200. I wonder if this is somehow preventing my Falcon from
using 57600 or 115200?

I can use 57600 as long as I am in 640 x 480 or a lower res.
I can dial out and get connected just fine with 115200. But it
is very, very slow at any resolution when I try using any Net/Web
programs like AtarIRC, Cab, Newsie, and etc.

I have tried to reconfigure HSmodem7 for my Falcon, but there are
some questions that pop up that don't seem to be explained in
the Documentation. I haven't been able to fully understand all
the options and settings in HSmodem7 for the Falcon.

What I really need is for someone that uses STinG with HSmodem7
on a Falcon that can use 57600, 115200 or better with fast and
stable results to send me their working DRIVIN.PRG and SCC.PRG
for me to try out and see if I can go higher than 38400.
I would sure appreciate it and it would help answer some
questions about my Falcons serial port.

STinG is a very good communications program for the Atari
machines. I am very glad to see that it is still being
updated. Hopefully more STinG/STiK applications will
come along such as ICQ and etc...
Don't Forget folks that STinG is FREE to the best of my knowledge.
And has helped many Atari folks finally get their Ataris
online. We all should be greatful to everyone who has helped
bring us this excellent application for our Ataris.

Someone should do sometype of live or slightly delayed
voice/music application for use over the net/web with

AtarIRC or etc.
That works with STinG and a Falcon or ST/STe that
has a Replay cartridge or similar device for recording sound.
I'm sure a Stock Falcon with 14megs is more than
capable of doing this. Sometype of video using videomaster
or Videomaster Falcon over the net/web would be cool too.

If anyone can e-mail me their working DRIVIN.PRG and SCC.PRG
that works at 57600 or better on a Falcon then please do so.
Thanks,
phantomm@kih.net

Hi Uwe,

I am happy to report that the Toshiba 2.5 6.4gig IDE works quite
well with HD Driver. I didn't format it BTW.

I never did send in my HD Driver registration card.
Would you accept a Scanned or Digitized image of the card
by e-mail. It would save me a little postage if that would
be alright with you. If not I'll get it out in the mail
soon. I've had HD Driver for some time, just forgot about
sending in the card. ;)

>It's a Mega ST, but, it has Tos 1.02 (I think). Anyway it's not TOS 1.4
>that can read PC compatible discs, as I could create these on the Mac..

All STs can read/write to DOS disks (assuming physical compatibility, ie
DD/HD single or double-sided depending on your machine). TOS 1.4 onwards can
format them too. If you have a TOS which doesn't format DOS disks, you can
use a suitable formatting utility - have a look round the FTP sites.

If your Mac formats proper DOS disks to DD 720k you should have no trouble
with the Mega.

Yup!!!!! Let's just add another sucker's story: Unca Lewey has something to share with you...

Awrite, I used this Sunday to work (at my work) plus do some updating. First there appeared to be some update for Okami (no probs), then I tried to update Sting. Well, it gave me one...

Went to this Swedish site, got the archive, unpacked into a new folder and put all the new stuff where it belongs. Just kept the Sting.inf, dial.inf, default.cfg, dial.scr, route.tab and cache.dns.

After the restart (new Sting.prg needs to be loaded) clicking the Dialer it said Sting wasn't loaded. YES, it was (said so at bootup). OK, need to click the Internal.cpx active again. So end of complaints.
Next it wouldn't do what it's supposed to, the initial connection went OK, but I couldn't get my mailer to work, the newsfetcher fetching news, whatever.
So I checked the ping: not OK. After that checked the CPX-es: appearently 3 of the 4 were not OK: don't show up when opening them in Freedom. Only the internals opens up. Re-install from the archive, no go.

Finally put back the 1.15 stuff, after that: same shit. Try the ping: after 17-18 datagrams coming back it simply stops. Onethousand going out, after nr. 18 comes back in: ROAD BLOCK. Spend hours on the configs, cpx-es, nothing weird but "no can do".

Finally suspected the port, since the port-cpx tells me the flowcontrol is greyed out, normally that would be "CTS/RTS on" but it's simply "unknown" according to the box. Check the port, run a terminal prg to a BBS, no probs. Try Sting again, check the ping, after 17 datagrams it stops abrupt. (I translate that into a flowcontrol problem)

Start checking the modem: powerup, it should read its config file, but nothing. Back to the terminal prg, try to feed the modem commands: no way.

Only after somany tries, flushing the buffers, issuing long breaks I get it to respond normally again. Check the default power up profile which seems to be OK, give it another AT&W0 command. Next an AT&Y0 command, once more an AT&K3 one, switch it off and back on and check stuff on the programs: finally everything's back to normal, and I can connect to the Internet again. So much for a bloody Sting update... I'm back on 1.15, and apart from the old TCP.STX module that I need to get decent speeds I really don't know what I need 1.20 for... At least not for 4-5 hours work to get everything back working.

It would have to be a reset proof IP/TCP stack, I think STinG's stack is
cleared upon reset!

Good idea though:)

Per the docs and discussions from years ago, I only use the Internals and
Serial CPXs. Rebooted, updated settings in the two listed CPXs and was
back online.

>So much for a bloody Sting update...

Which is working just *fine* here. One other difference, I believe I
dumped the DNS Cache during update. Seemed wise, not knowing if file
formats would be the same. Kept DEFAULT.CFG, ROUTE.TAB and DIAL.SCR.

I appreciate the year of effort and am certainly willing to give it a
thorough run.

Well Im back and I still have a bunch of ATARI STuff that Im not using. I have my TT and MSTE at this time I think and the Wife thinks thats all I need. I have listed the items I have left on my web page. Just goto Atari Yard Sale to see all I have left. |I also have a bunch of software that needs to be posted I had a list and I lost it. So I must take the time Again to see all that I have and list it on my pages. I still have my Atari Sparrow pages online as well. I have sold the Sparrow to a fellow Atarian but, you can still see what it looked like inside and out.

I havent been to active on here in the past months due to deaths in my family and deaths of freinds. And alot of time at work and alot of time with the family..

The pages are not anything fancy but, they get my message acrosss..

Source record: 80464
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi everybody,

I've been in the 8bit scene now for a while and have a full collection of every Atari 8bit item made. Now, I'm starting to get into the 16bit arena now and just bought a 1040STf with a 1224 color monitor for $25. Everything works, it boots up but I want to hook up a Hard Drive to it.

My two questions are,

1. Which would be better, IDE or SCSI. I've seen alot on both

2. Which ever one is better, what device would be the best way to interface to the 1040 and other St's.

I did not get any disks with the system, if anybody know a FTP site with images of the original disks, that would be great..

Thanks everybody,
Jason(Mr.3DFX)

>>threads and stuff, I use newsie, i clikced on com.blah blah blah and
>>there were only 16 messages, it that all that's there?

It could be that there aren't any more articles on your news server but,
just to make sure, you can ask Newsie to start its next fetch at an
earlier number than it normally would. To do this, single click on the
newsgroup name and press '?'. This will open up a dialog box with 2
editable lines. If you reset them both to 0, Newsie will fetch all the
available articles for that group on your news server.

>It will build up in time.
>
>I'm using Turnpike on a pc at the moment at when I add a new newsgroup
>it always takes a while as you don't get ALL articles in the past
>history. It'll soon build up;)

Since it's related, even though it's off topic, here's how to get
Turnpike fetching news a few days before the present.

1. Select the menu option File->Configure->Newsgroups. This will open up
a dialog box.

2. Click on the newsgroup you're wanting to fetch earlier articles.

3. Under the New News details select now, for a new group, or last, for
one you've already got articles from.

4. Select minus and either hours or days, depending on the groups
traffic. I started by going back a day for all the groups I subscribe
to, since I knew in advance just how much traffic each group got.

5. Enter the number of hours or days to go back in the edit-box.

6. Click on 'Apply'. If you don't do this and start altering for another
group, the settings you picked are ignored.

7. Repeat steps 2 to 5 for any other groups you want to alter.

One final tip. if you've just subscribed to a few new groups, control-
clicking on them allows all of them to be reconfigured with the same
settings.

Good, Alex did my install and I haven't had any problems with it at all. He also did all the Steinberg-recommended audio mods.

>As far as memory goes, I can't recall which memory board I have (I got it back >in 1995), but I do know for certain that it uses a 72-pin 16meg SIMM. As far >as whether it's 70ns or 60ns, I couldn't say.

My ram card is from Wizztronics, the SIMM... I don't remember, but it is a 16mg SIMM.

>And after perusing the NEMESIS manual a bit, I see that it won't work with ICD >hard disk driver software. DOH! I use ICD PRO 6.4.4 - but I called SFT today >and ordered HD Driver; something which I've been meaning to do anyway for a >few other reasons (like DOS/TOS formatting compatibility).

This is NOT TRUE... they say that SOME versions of ICD won't work. I imagine they mean some older versions. I have ICD Pro 6.5.5 and it works with Nemesis - no problem. I was concerned about this too, but was pleased to not have to fork out more moolah.

Yes, I am quite sure that it works only with Notator and not
Logic. The box is catually by C-Lab and Emagics Logic requires a different
box , the Log 3 or a different Unitor.

Raymond

PS I had to buy Log 3 because Logic would not work with my SMPTE Unitor
box.

Sounds spiffy! But we would all like to know the platform. I mean, I guess
we could run an emulator to run an emulator if we had to... btw: has
anyone ever gotten PC-Ditto to work on any ST emulators? What's really fun
is running the Apple emulator on the ST emulator on whichever platform
you're running. (or, even better inside an opposite platform emulator).

Yes. I know. I am wierd.

>
> btw.. we are looking 4 a name 4 it... pls help

well it will be a while before I buy or find CAF

I had a look at your very informative site. It seems you can use an external SCSI zip as your audio recording drive. Is this so? Is this a practical option? How much can you do with only a 100Mb?

cheers,
jim

That's freaky, you Americans live in a big old country. Let's say a 'state' in the US is equivalent to a 'County' in the UK. I live in the county of Sussex. Do you know how long it would take to drive from one side to the other? About 30 mins !!!!! Infact a 7-8 hr drive in the uk with good traffic would probably get you from the south coast of England to well into the Scottish Highlands!

eh anyway, I said it was a bit off topic

From: mt--------@telebyte.nl
Message-ID: <7fck4e$3v9$1@rubens.telebyte.nl>
Source record: 80508

I downloaded and installed the new STinG version 1.20.
I tried it with CAB 2.7 and NEWsie 0.94.
It works, but I don't see much improvement. My computer hangs and
crashes more than it used to with STinG 1.15. I can hardly click with
my mouse or close a window without trouble, I have to reboot again
and again.
I was quite satisfied with STinG 1.15 and have re-installed this
version again.
Why are updates of good working programs hardly ever an improvement ?

I don't need more options, I just need reliability.

I'm using one simple Atari 1040STf with 4MB ram and single tasking
TOS 1.4. I have the dialer installed as an desktop ACCessory.

>far I've heard of a terminal cartridge and the Spectrum (Macintosh
>emulator) cartridge.

Unfortunately the boffins at Atari decided to leave the WRITE line out of the cartridge memory area. Most cartridges that need to send data use the read line to tell the cartridge to read etc.

>
> What else on the ST was/is cartridge based?

There are all sorts of cartridges, one operating system springs to mind but I can't remember what it is.

I do have a terminal cartridge (VT100) in my cartridge collection.

Yup. But having been a NEWbie the number of answers I received that were
polite far outweighed the rude. Its good to have both NEWbie ST users and
NEWbie NET users in this forum. It is a happy growth to see an ST going to
a home where someone is trying to use it vs it going to the dump.

Martin,

When you installed 1.20, you have to install everything. The only thing you
can really keep is your Dial.scr and route.tab files. Everything else from the
old version has to be replaced.

I had no probplems, but I was using a TT030, with Magic 2.0 (Ya I know, OLD!).
I used it with Cab 2.5 & 7 and had no problems.

I installed 1.20 myself last night, and had a hard time getting
connected (couldn't find IP address, crashes, etc.) However, I
installed it again, this time making sure to remove all traces of 1.15
(that included the .CPXes) - and once I re-installed DEFAULT.CFG and
the Dialer's DIAL.SCR files things worked much better. In fact, I think
it's downloading a bit smoother now.

BTW, it's a new Dialer too, so you'll need to replace that as well.

1099. Re: cartridge stuff

Newsgroup: comp.sys.atari.st
Date: 1999-04-18 00:00:00 UTC
From: Steve Stupple <Steve@steverosie.demon.co.uk>
Message-ID: <MH0VeTA2AeG3Ew0e@steverosie.demon.co.uk>
Source record: 80516

In article <7fbn9oruj1@as102.tel.hr>, vuk-@geocities.com writes
>On cartridge you can have:
>raw data
>programs
>diagnostics program

There are 2 types of cartridge; application and diagnostic. The cartridge can be run before ANYTHING, Supermon's virus check uses this feature. Some cartridges, such as the Ultimate ripper, are responsible for setting the system memory.

So RAW data is possible, dongles spring to mind, as these will be accessible between the $A0000 and $B0000 128k memory block.

Programs, such as back-pack etc.., must have the correct header AND must have external variables pointed to RAM outside of the cartridge. You must also use the usual memory allocation process; you don't want other applications running all over the data tables if it runs in the back ground or loads files etc...

Diagnostic programs can take over the complete system and perform check etc. The Ultimate Ripper can be used to start with a different memory config!!!!

As far as I know there are 2 types of header. All the info I have, including the official Atari notes, give the WRONG header!! Only one reference books actually tells you the correct one. This had me baffled for ages when I started on a cartridge of my own.

It is also possible to have multiple programs to be on cartridge.

>
>
>Diagnostic can be started before any vector set... that means before TOS
>Files can be put on cartridge so it work as regular disk partition, named
>c: (yes, small letter)

Only Atari desktops allow access to the small c: (cartridge) device. It would be nice to be able to access the cartridge within Neodesk, Kaos, Thing etc...

If my memory serves me correct the system jumps directly to the cartridge area (if the header is correct) and then the cartridge does it's bit. This is how the Ultimate Ripper can do what it can do.

Being able to use it as a regular partition would be tricky, you would be more accurate if you used it the same way as a CD-ROM, only smaller!

Samplers, EPROM programmers etc.. tell the cartridge to accept input by
using the read lines to inform of direction.

I wonder if it would be possible for a hardware project enabling a write
line to the cartridge area!!!

Hi, for sale -

Portfolio memory expander plus, adds 256k mem or ram disk,
provides 2nd card slot (disk B), with thru port for other
peripherals. As new with manual and box, 25 pounds inc P&P.

Portfolio System Case, zip up case with room for
your Portfolio, 5rom cards, interface, spare batts and
manual. As new in box, 6 pounds inc P&P.

Would consider swop for Portfolio mem cards.
Regards, Steve.

|I used it with Cab 2.5 & 7 and had no problems.

Rob,

Same here. I installed everything and away I went. I didn't notice an improvement with the new version, but then again I wasn't having problems with the old version except for more dropped packets than I would have liked to have seen. Um... scratch that. I just checked the 'Statistics' tool from within STinG, and I'm showing NO dropped bytes at all. Yee-ha!

As a side note, while I was mucking about with software upgrades, I also put together a 4 bay SCSI case with 2 CD-ROMs, a 100mb ZIP, and an old hard drive from an inactive MegaE. All the SCSI cables I'd accumulated over the years had begun to give me mongo SCSI errors.

With the two CDs, now I can use ImageCopyCD (GREAT piece of software!) while scanning pictures and listeninng to my favorite Jimmy Buffett tracks (The Weather is Here, Wish You Were Beautiful / Why Don't We Get Drunk... / Pencil-Thin Mustache / etc.), browsing the web, and reading the news groups. Is this 'Psycho-Nerd Heaven' or what? <g> Now all I've got to do is figure out how to use IRC and I'm set! Of course, someone will come out with a new piece of software that I've simply got to mess around with, but that's what keeps me young, I guess. <smile>

I still prefer my SyQuest 230 megger to the ZIP. It's faster and, no matter what Iomega says, I still can't bring myself to trust floppy technology with 100 meg of data per disk. But the SyQuest is an external unit, and the ZIP fits in the new case very nicely.

Take care,

Joe Mirando @ A-ONE Magazine

Hi ,

Talking of cartridges is it possible to knock up a simple ram cartidge which can be used as a ram disk?

Anyone know how this could be done?

I find a ram disk indispensible nowadays, and a 'ram cartidge' would be a neat way of creating one without using up that vital memory in these days of multitasking.

Cheers!

Paul Mac

Steve Stupple said...

I'm from the 8-bit school. I started with a ZX81 with a massive 1k memory, way back in 1981!

Pity, you could have had an Atari 400 with 16K for only $400 in 1979. :)

By 1982 I was buying that very 400 for $150 with a $50 rebate at Best Buy. It was at that point Atari was affordable enough to step into my home. ;)

Well, I'm currently trying to secure one of those VT100 cartridges for my BBS usage. Hope to get an answer back soon.

In the meantime.. hey.. does anyone here make cartridges? I would like to find out what cartridge based programs existed.. maybe pick up a few in the future. Since I like collecting Star Raider items.. a ST cartridge of Star Raiders would be cute. :)

And if we can make cartridges.. I would like to find a program that supports ansi that I could port to a cartridge. The first big trick is finding on under 128K. Freeze Dried term for example handles ANSI.. but unfortunately is 441K. :(
But then it has a lot of bells and whistles.

Hey.. let's talk.. it's good to talk!

Ah.. need an emulator? A P200... is that a 200 mhtz processor PC?
Well, at any rate.. with the PC you have many options...

GEMulator .. adds the roms and flawless operation of the Atari on a
PC.. well, it is said to be one of the best. Though some have had
problems as of late dealing with GEM on this. Don't know the details.

TOSBox... great emulation environment.. Dos based. Been playing with
that one lately. A real hit with 486 users.

PacifiST & Winston... good windows based emulators. Played with them
briefly for some of our local users.

Anyway... there is a brief overview.

Now if you ever want to play with Atari on Macintosh...(evil grin)

Doctor Clu

Having fun with MagicMac making my 68030 Mac
A better Atari than it is a Mac. ;)

Yeah, what was done to it, anyway? It doesn't seem any different than 1.15, and I can't find anywhere in any of the documentation a list of improvemnts or bug fixes. Well, since we're in the STiNG-upgrading mood now, here's a list of some things I'd like to see done with it:

1. When I run a login.bat file under Geneva/NeoDesk, the Dialer gets "put to sleep" while the program is run. But when I'm through, it gets "re-awakened" but doesn't return to the screen unless I put it back into sleep mode manually and then wake it up again. This is of course a big hassle just to disconnect. If STiNG could somehow notice when it's been re-awakened and update its window or something so that it's on-screen, that would be wonderful!

2. Not specifically a STiNG upgrade, but...

!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
! *** I NEED ICQ FOR STING!!! *** !
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

Anyone willing????

>the web site is http://www.emulators.com/

Also in the commercial sphere there's MagiC-PC, not much use for games, but
nice for most other purposes. NB you need NVDI-PC or NVDI5 to get the best
out of it.

Not much. I have heard of an Atari diagnostic cartridge and a kit for making your own cartridges. Otherwise it's been mostly used for dongles (eg Cubase, Notator), real time clocks (eg Forget-me-clock) and scanner connections (eg Golden image, AlfaData, Naksha).

Alright.. I hang my head and admit.. my 68030 Macintosh under MagicMac is becoming a better Atari computer than a Macintosh. This is crazy! I thought emulators were supposed to DETRACT from the processor speed.

Please write me at greg@atariusers.com

Would like to hear from other MagicMac users, hear the pros and cons about it.. I'm thinking of registering but just trying to gather some information first.

That is the main bulk of the message...

Doctor Clu
Enjoying MagicMac demo on the 68030 Macintosh.

Other thoughts for those reading onward...

-Page Stream... runs blindingly fast (at least compared to the club 4 meg 520 ST fm). It's had trouble recognizing GIF files. Is this a page Stream setting I need to set, or a MagicMac compatibility problem?

-Freeze Dried term.... freezes. :) Is there a special way you need to set up the modem port? This is VERY important since I am planning on experiementing with CAB.

- Here's a fun question... is there any way to have Magic Mac setup so you don't need the Macintosh System at all.. but can run it STRAIGHT OFF MagicMac? (grin)

That'd be fantastic. A UUEncode will be perfect, but that now leaves me another problem - how do I get this onto the ST ?
It's a Mega ST, but, it has Tos 1.02 (I think). Anyway it's not TOS 1.4 that can read PC compatible discs, as I could create these on the Mac..
Any ideas?

Thanks for the reply and help :)

EPROM Programmers, backpack (all the code is in cartridge and the acc
accesses it), Robokit (robotic type interface), Fast BASIC, stereo
output devices, ripper (inc. multiface ST), cartridge prototyping
interface (allows experimenting like a breadboard) there is more but
can't think at the moment.

There's more than you think.

The problem is that Atari didn't allow a write line, so access can only
be READ from the memory.

I don't know how practical it could be to use a read line to allow
access to a very limited RAM disk!
>
>I find a ram disk indispensible nowadays, and a 'ram cartidge' would
>be a neat way of creating one without using up that vital memory in

The last time I bought an empty cartridge board thing, no idea what they
are called; it is a circuit board with 2 DIL sockets and a jumper to
select which type of chip you're using. These cost ï¿½15.95, and I bought
the last. So if anyone know where I can get some of these, or has
knackered ripper cartridges, please let me know;)

>Why are updates of good working programs hardly ever an improvement ?
>
After reactions in this newsgroup I tried again, carefully
re-installing all Autofolder, Sting, Dialer and CPX-stuff.
Now it works, but I'm still having problems I did not have before.
(Remember I'm working with an ordinary 1040 STf (4MB) and
single-tasking TOS 1.04)

I will describe what happens, maybe it makes any sense to someone:
- I used to start XCONTROL as an .APP instead of as an an .ACC
sometimes, to save memory. But if I have STinG 1.20 installed I cannot
open the XCONTROL panel this way anymore. That is, the panel-window
opens, but stays empty and I have to reset the computer.
- If I run CAB 2.7, I cannot start Newsie from there. I'm getting a
menu bar that can't be opened. And again a resest is the only way to
escape.
- If I first leave CAB, while online, and then start Newsie. No succes
either.
- Other strange things that force me to reboot my computer.
These are not all necissarily STiNG 1.20 problems.

To me it sometimes looks like all the Atari users and developers on the
net are fanatics with heavy configurations (Atari Falcon 030 or TT,
or a little network with several Atari and MAC computers running at
the same time, huge harddisks, fast modems, MagiC, NVDI etc.)
I am wondering if someone with a more modest configuration like mine
is running STinG 1.20 without many problems ?

|Joe,
|
|Can you explain how they would set it up with cab. I have not tried it.
|<snip>

Sure Rob,

All a user needs to do is use CAB 2.7 or other cookie-aware browser (we don't _require_ the use of an Atari for this, but we might razz you a bit for using anything else <g>) to access Delphi (http://www.delphi.com) and find the Atari Advantage Forum. There is a complete address for the forum, which I'll post after I find it, but there is no "Chat Link" yet on the AA page. I assume that Dana, the Forum Manager, is working on having that oversight fixed, but as Delphi is in the midst of software changes, it might not happen for a little while. Perhaps Dana will drop by here and provide the proper address. (Dana? Is you 'round here?)

Of course, you need to sign up as a Delphi member, but there is absolutely no charge for the service, and it allows you up to five MEG of space for a web page, email forwarding, and a public and/or private forum. While other services were simply talking about allowing free access, Delphi was forging ahead and making it happen. It's a far cry from when I first started telecomputing on "The Largest Online Service in the Universe", when prime-time charges were $36.00/hr. and the fastest you could go was 2400 baud.

Oh, by the way, the established Atari Advantage chat is Tuesday evening at 9:00 pm EST (GMT -5:00), but I've known people to just drop in any old time to see if anyone wanted to chat.

>
>Anybody have any ideas please?

That's because TOS 2.06 sets the floppy seek rate to 6ms which, when used with an HD floppy, gets halved to 3ms. Magic, on the other hand, defaults to a 3ms seek rate which, when used with an HD floppy, gets halved to 1.5ms. This makes it almost impossible to write anything beyond the first track. The only way to do anything about this is to stick a small program in the auto folder to set the seek rate to 6ms.

If you got the high density upgrade from TUS, there should have been a small program on the disc supplied that sets the seek rate to 6ms. If you haven't got a copy of it, mail me and I'll send you one that does the same thing.

I use this program with XBOOT and all is fine. Perhaps your version of Falcon8 is corrupted? Anyways, My problem is getting some decent colour printing from my HP 660C. Colour raster graphics look like crap and I haven't figured out why. I have Calamus 95 that came with my Falcon. I also owned 1.09n. I am not certain if the 95 version has a 2 computer limitation but 98 apparently does. This is what is holding me back from upgrading. I have a couple programs that use this technique and it is making me paranoid. Anyways, I haven't put alot of effort into the colour printing, simply, opened a document, loaded a gif raster graphic and hit print to test my used HP that I picked up. At least the Vector graphics look good. Later Brian.

Well, at tonight's NS Atari Users Group meeting in Hlifax, we determined that many (too many) of our new members are still struggling with 1040ST's with the stock 1024k of RAM. One person suggested that we send them out one at a time for upgrades, but I figured that even the lowest cost Wizztronics board would go for more than a still-working Atari Mega ST2/4 or 1040STe.

Anybody got a spare computer to sell us? If we have to wait until the TAF flea market they may get into some other platform. Heaven forbid.

Tell us what you have if anything.

hello,

It depends..

For Games.. the best is PaCifiST. the url is..
http://www.pacifist.fatal-design.com/
latest version is from 16th June 98, 0.49beta (Giftware)

Then my favorite.. TOSbox.. for running mostly utilites
that url is... http://www.emuclassics.com/tosbox/
latest version is 1.08, release date March 27, 1999. (Shareware)
and last..
GEMulator best for "all around" performance, but this is a commercial program

the web site is http://www.emulators.com/

On 10 Apr 1999 05:06:14 , Phantom wrote:
> <edited>

I'm still in the market for a new/used Atari ST 5.25
external floppy disk drive. It doesn't have to be a Atari
made one as long as it works.

The Golden Image Master 5S 5 1/4 is the one I would
rather find. But any other brand will be fine as
long as it is in good working condition.

I do have a PC 5 1/4 floppy with a homemade cable
to connect to a ST but the wires have got disconnected
on the drive connector end. If anyone has a text
file on how to wire it up properly then e-mail it
to me if you don't mind.

But I still want a Atari ST 5 1/4 floppy drive,
someone in the USA surely has one thats not being
used. ;)

Also, if anyone in the USA has the Golden Image
Master 3SD 3 1/2 (The one with the LED Track
Display) then I may be interested in
purchasing it as well.

E-mail me at....phantomm@kih.net

I just wanted to thank everyone that followed up on my NEMESIS-questions post.

Looks like I'm going to have Alex at ATY do the install for me. I'm not to bad with the soldering iron, but I'm a little scared to mess with my "proud bird" by myself.

As far as memory goes, I can't recall which memory board I have (I got it back in 1995), but I do know for certain that it uses a 72-pin 16meg SIMM. As far as whether it's 70ns or 60ns, I couldn't say.

And after perusing the NEMESIS manual a bit, I see that it won't work with ICD hard disk driver software. DOH! I use ICD PRO 6.4.4 - but I called SFT today and ordered HD Driver; something which I've been meaning to do anyway for a few other reasons (like DOS/TOS formatting compatibility).

I'm actually going to drive up to ATY Computer in Oakland, California with my Falcon this Wednesday so Alex can do the work. I live in Southern California so I'm looking at about a 7-8 hour drive each way! But hey, I guess we Atarians are a bit "die hard" [read: warped/deranged/obsessed/insane/etc.] so this shouldn't come as much of a shock to anyone here... ;^)

I'll report back when it's all done. Wish me luck!

> haven't figured out why. I have Calamus 95 that came with my Falcon. I also

Brian, In SL 98 when you go to print with an inkjet like your HP 660C
make sure that you have "Ordered Dithering" enabled. This will make
raster graphics print a lot better. If the colors look flat or grayed
out, you will need to reset the control lines also, specifically the
UCR/GCR lines in the color separation module.

I don't think the program will "bomb" if it is loaded more than two
times-ala "Studio Photo".

Source record: 80644

In a former life as an exotic dancer, jim harris <jim@studio9.demon.co.uk>
wrote:
> Hi Hallvard ... see post above for details of Noboxe48, an easy to get
hold of commercial expander (www.padworld.demon.co.uk). Also there was a
recent thread on this very subject, scroll up and you might find it. To recap:
to squeeze 3 midis out of modem port requires a non-trivial circuit and
software drivers. The technique employed as I understand it is to quickly
switch the status of one output to three destinations, 'port switching'.
As for reverse engineering the Noboxe it's creators rather wisely permanently
obscured the ID's on the three IC's that it uses.
>

Only 3 ICs? I'm sure that between us all we could reverse engineer something
that simple, even without the IC numbers.

If the outputs are simply "quickly switched" versions of one of the outputs,
then the circuitry cannot be much more than a mutiplexer and some buffering.

BTW, does the Noboxe connect to the serial or parallel port? IF the former,
then I suspect it's not multiplexing, as that would require the unmultiplexed
signal to be switching at 3 x MIDI frequency. Given that the speed for a single
MIDI port is 31250 baud, and the serial port officially only handles 19200,
I think 92750 baud would be pushing it somewhat. Does anyone know what the
serial hardware tops out at on an ST? I don't have any docs to hand, but I
thought that even if driven directly it wouldn't manage more than 57600
reliably.

Anyway, if you can trace the circuit, even without the IC numbers, I'm sure
that we could work out the details of it. It won't save you the money you've
already spent, but it'll help others out no end.

1145. Reading Atari ST Single Sided Disk

Newsgroup: comp.sys.atari.st
Date: 1999-04-19 00:00:00 UTC
From: "Robert A. Rosenberg" <hal9001@panix.com>
Message-ID: <371BB4E6.FD8A6C26@panix.com>
Source record: 80348
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I am posting this query for a friend. She has some old Atati ST Single Sided disks that she wants/needs to recover the data from (it is pure text so the logical format of the data is not an issue). I know that if they were Double Sided that they would (supposedly) be readable as normal Windows Disks (possibly first requiring that a zap be done to a field in the Directory). Does anyone know of a MS-DOS/Windows utility that would allow Single Sided Disks to be read (the SS format was not supported by MS-DOS so it will not be seen as a native disk unlike the DS disks).

Thank you.

From: mlake@melake.erols.com
Message-ID: <slrn7hnf3g.gtl.mlake@melake.erols.com>
Source record: 80350

I recently purchased a Riebl network card. Apparently there are quite a few at B & C Computer Visions in Ca. Phone, 530-295-9270. Email, myatari2@juno.com

I was told when I purchased the card that I would have to replace the battery. I'm no good at this kind of thing but it appears that the battery is soldered onto the board. Could this be? Can anyone give me directions for replacing the battery? What is the battery used for on this board anyways?

No docs came with the board. Are there some docs available someplace on the Net?

Thanks for any help.

You don't need the last two with a DIALUP connection so I haven't tried
them. Internals works here with COPS so you may be looking at Freedom
incompatibility -- that's not to say that the problems isn't in the CPXs,
just they do work fine here.

Hi, well that is why I still use the old Stik 1.09. If I have to
reset my Falcon for any reason, I just boot and type the ip number in stik
menue and the connection continues. I have set stik ip file to write
protect so I have to enter only the last 3 digits from ip which are the
ones that change. My ip is always 128.227.163.xxx so I manually enter the
last digits. I can even do a connection with Stalker and then change to
slip without disconnecting and continue with a slip conncetion.

It would be great if I was able to do the same trick in MINT.

Hi;

I'm using an STf and am trying to have a CPX program boot up automatically by placing it in the AUTO folder. It's been a while since I've done this, and I can't remember what to do. Does the CPX extension have to be changed to something else?

Thanks
Chris

->adaptor board as well as the speed of the RAM itself. The ActionSoft board
->is alledgedly one that has a problem (and guess which one I have!) The fix
->is to change back to the original (as you've said) or ignore the visual FX
->which are otherwise harmless.
->
->Rgds, Derryck

Hi Derryck. Nope, the "visual fx" are not completely benign. At least they were not on my Falcon. When running something very intensive like Aniplayer, it would give error messages and sometimes crash hard. If I dropped back down to Nemesis "LOW", then the visual FX would go away and all programs would work fine...

BTW, I wasn't singling out Aniplayer which is a great program (in fact I registered it!). There are other video/Ram intensive apps that crash like this too...

A lot seems to depend on the individual Falcon, as well as the Ram board, and Ram combinations...This is just my experience.. ;-(

Like I said though, why take a chance? Get the most recommended combination of Ram and board the first time... I went through, in this order:

Chro-Magic Ram-Gizmo...with 4 1 meg SIMMs 80ns. (very messy/crashed a lot)
Same card: ...with 4 1 meg SIMMs 70ns. (a little better but not
much-tried the 70ns SIMMs
because a user swore it
worked for him. Maybe?)
Systems For Tomorrow: with 1 16 meg SIMM 70ns. (much better, can almost run
in Nemesis "HI" Still some
artifacting)
Same card: now switched to a 60ns 72 pin SIMM. (Again, an improvement, almost
perfect, just a little fx in
window sliders, etc)

Next? Well, I'm still looking for the Panasonic shielded 72 pin 16 meg SIMM. I've not been able to find one locally and don't know where to order here in the USA. Anybody else know? ;-)

Count up the money I spent on Ram and Ram board upgrades to get where I am today. Not funny, huh? Titan told me not to do this, to go with their 1st and best recommendation but other Nemesis users kept telling me that each of the combos above that DID NOT work for me, DID work for them. Go figure.

Well, I hope you get a good solid setup soon. Once you do get Nemesis working right, you won't want to be without it. I love mine, despite all the "teething" problems I've had...<grin>

Catch ya later! ;-)

CPX files are control panels that must be loaded by XCONTROL.ACC. You
definitely don't put them in the AUTO folder. You put XCONTROL.ACC in
your root directory, and creat a folder called CPX for example where you
will put all your CPX. Then you set XControl to point the CPX directory
and you can activate/deactivate them from within XControl.

You can get Xcontrol from the Quick FAQ.

> possible to play PC games such as Quake on my Falcon under a emulator ?

No chance. An '040 could barely run Quake natively (if it was available for
the Atari platform), let alone under software emulation.
As a rough guide, the AmigaQuake (commercial release) runs fairly poorly on
an '040 Amiga even with the code highly optimized. An 060 is the mimimum
for a decent framerate. ADoom requires an '040 for best results.

Not to mention the lack of easy expansion options for such things as RAM
expansion. The HDD port was a good idea though.

> The composite video on the ST (if you're lucky enough to have Composite
> video on your ST) isn't broadcast quality.

Bummer eh?.

> MIDI THRU port incorporated in a non-standard way in the MIDI OUT port.

I thought it was a good idea in theory at first, but in practical terms it
was a disaster.

> The mushy, weak keyboard on the ST.

The case was a bit of a bugger to get apart too, not to mention that
justabout all the chips where soldered not socketed on the mainboard. Not
very hacker friendly ;-)

Why not just do it on a PC?. Why do you want to do things on an ST that is
easily done on a PC?. Some things just aren't do-able on a 1Mb, 8Mhz
eighties computer... of any kind.

> Holier-than-thou users who when you even hint that you use "one-eyed"

> putting money in the pockets of the developers.

Nevertheless, breaching copyright IS illegal, and technically theft.

Mellow out, the pirates
> are almost the only ones still supporting the ST anymore.

I really hope that isn't the case for the ST's sake.

> The way our devotion to the Atari ST attracts flamers and trolls who like
> to come on this newsgroup and say "You guys are losers! Buy a PC/Mac
etc."
> It's even more annoying when the trolls are people saying we should get
> Amigas or Falcons.

How many Atari users slag off other platforms that they haven't used?. It's
the same thing. I own(ed) PC's, Amiga's and Atari's and I no longer own an
Atari... you work it out.

> People who seem to only use their Atari to run an alternative operating
> system so that they can flame people who run a different alternative
> operating system on their Atari.

That happens on all platforms, and isn't an Atari specific problem.

> Having one of your messages about the ST completely buried under a flood
> of the above mentioned OS-War posts.

OS-Wars are fun, especially when you read some of the BS that people come
up with from time to time. We all know that AmigaOS is the best now don't
we :-p

:-)

Note the smiley, it's important!

> People who are unneccesarily rude to newbies who ask a question like
> "How do I hook up a hard drive to my ST?". There's no need to post back

a
> practical option? How much can you do with only a 100Mb?

It's possible to use a Zip, but not with more than 6 audio tracks
simultaneously if you run at 48kHz - and without any fragmentation...
If your disk becomes fragmented, the possible tracks will probably
decrease rather quickly, but I believe it would be possible to count on
4 audio tracks in daily use...
The 100MB will be sufficient in many cases, much depending on how much
audio you use. Each mono track uses about 5MB/minute, which means you'd
be able to have about 5 minutes of audio on four tracks throughout the
whole song on one 100MB disk. If you don't use 4 tracks through the
whole song, you'll be able to have longer songs...

Best regards,
Claes

> with the Mega.

You know, I really amaze myself sometimes. Of course all STs can read PC
format floppies! Doh! (It's been around 7 years since I owned my last
Atari, the things you forget..) :-}
Anyway, I've just formatted a floppy on the iMac. It worked! :-) All I
need now are some DD disks, as I've only got a couple of HD ones and
they are all causing problems on the Mega ST...

It's all slowly coming back to me now, and I'm getting used (again) to
the ST. (seems so similar to the iMac, yet so different!).
Wish I'd have got s/w with this Mega, having to start from scratch is
going to be an enjoyable challenge :-)

What are the better web/ftp sites to download ST utils/PD/demos/etc?

Thanks for your reply and help, appreciated.

Colour modes is what I'm after tbh. I don't really need mono as I've got
the iMac for all my work. So it's the games and demos I'm after ;)
(along with a few utils of course!)
Which Atari companies are still around that sell the Scart leads?

Thanks for the help, Nick.

I would go with Pacifist. You can load whatever TOS version you want (some programs need certain versions to run at all). You can download TOS images and Pacifist from the Little Green Desktop. In order to use your Atari disks on the emulator, you'll need a program called Makedisk... this will create a *.st file that Pacifist can use. With a little bit of research you can learn everything you need to know. I would bookmark the Little Green Desktop.

The Little Green Desktop
http://lgd.fatal-design.com/

Atari Hyperlink Launchpad (bookmark this, too!)
http://www.geocities.com/SiliconValley/Bay/8745/

Note: The TOS images are copyrighted. So are the plethora of games available on The Little Green Desktop.

Have fun,
Andy Blakely

Hey, you can get the Master 5S drive from the URL below. It's only
$34.95 US.
Hope this works for you. Also there's lots of Atari software for
cheap. Lots of games and utilities.

http://www.colourfull.com/Merchant/merchant.mv?Screen=CTGY&Store_Code=colorstore&Category_
Code=hardware-atari

Later,

Guess you have been working too much with pc:s lately :-)

It's _very_ unlikely that STinG could permanently alter your modem
config! Well at least not until you put in some strange init string
with "&W" or the like in the dialer, which you should never do!

I have no problems at all with the new STinG! This is also on a TT
(without tt-ram btw.) Works better than the old one. Tested with Geneva
with/without Freemint 1.14. A very nice upgrade imho.

I do not like mysteries. Maybe there is more to tell about this card?

Anyway, Ethernet cards become scarce.

So maybe it is a Riebl card? Then (with the jumpers reset) it could
also function in a TT. And NiNTnet can handle it.

Source record: 80420

My 5-year old niece is starting to develop and interest in computer games, and I've gotten her hooked on a few old ST classics (she doesn't have the patience for PC sports games, and somehow I don't think DOOM is a good introduction :-).

Anyway, my tired old joysticks are starting to fall apart. One still works quite well, the other is dying, and a 3rd one is totally dead (you know, plastic circle attached to handle broken).

Anyone still selling these sticks? I'm in Ontario, Canada and obviously would like something not too far away if possible..

Or, has anyone done a hack to connect something like a PC gamepad?

I would prefer email - I don't have time to read this group much anymore.

Thanks.
Mattias

I take it you are talking about the part that hold the key itself and
presses onto the rubber cups!

If these are the same as the ST's keyboard them I can help.

Hi Kenneth,

well, whatever causes it, but everytime I had this new Sting put up and gone back to the old set, I experienced troubles pinging. Since I couldn't find any files to be wrong, there must be something else. I found that reconfiguring the modem solved the troubles, though the last time it took me longer than expected. God knows why, but issuing commands like AT&K3, AT&R0 or AT&R1 and just storing those profiles again did the trick...
My inits never show anything else than ATZ or ATZ0. Never had problems with that, also the init for Sting is set at ATZ.

But: how come the internals cpx goes kaputnik once you click "save settings" after you ticked the active box? It happened two times: it was unpacked into the dir, then opened, activated, so the stuff started running and because of the "save" operation it went corrupt: not to be opened up again. Never had that on old versions.

Another weirdo is the flowcontrol box in the CPX-es: it is greyed out and simply states "unknown"... I'm pretty sure I've seen it displaying "RTS/CTS" long time ago when I set Sting up.

Anyway, Sting 1.15 works great as it always did for me.

And please don't mention those PeeCee's rite now, tomorrow's reserved for PC-fighting again... :-((and the rest of the week).

1194. STinG 1.20

Newsgroup: comp.sys.atari.st
Date: 1999-04-19 00:00:00 UTC
From: shammond@loop.com
Message-ID: <sNLS2.37809$Ld5.93700@news2.randori.com>
Source record: 80433

Downloaded and set it up in a separate folder. Replaced the older CPX's and set the STING.INF in the Auto folder to point to the proper partition and folder for the new *.STX files. Used my old dial.scr. Connected to my ISP with about the same type of problems that I had with the previous verison.

1) It takes two,three sometime four attemps before STinG will pick up the DNS number for that session and itinialise the link. Does not make any difference if I am connecting using SLIP,CSLIP or PPP. OTOH, STiK will nail the connection on the first try, every time. The total time to get on-line with STinG, in all fairness, is still shorter than with Windows 95/98 using the same local number.

2) The 30 to 40 second sending mail delay is still there as it was with STinG 1.15. With STiK the connection negotiation is almost instantaneous.

3) POPWATCH 2.91 will no longer send queued mail from Newsie. Mail can be picked up. Newsie will send the mail, OTOH. This worked fine with STinG 1.15 and the older *.STX files. FWIW, I had a number of problems with TCP.STX versions dated later than 13 Oct.98. According to e-mail with Peter these problems were hit and miss and seemed to be ISP dependent as other users using the same set-up had no problems. Typically the problems were with verrrry slow data transfer speeds.

4) CAB 2.7 (CAB.OVL 1.3101) seem to have a little higher overall connection speed compared to STiK or STinG 1.15, BUT I am getting a lot more pauses during the downloading of pages or files so the effective speed is slower.

5) Uploading of files (mail) seems to be faster compared to STiK or STinG 1.15. However, with the 30 to 40 second delay in connection the uploaded file needs to be in the 800K range before there is any advantage over STiK.

6) Downloading and uploading of mail with MYMAIL is faster when the connection is done with STinG - either version. With Newsie/POPWATCH data transfer is the same using either STiK or STinG. As noted above POPWATCH and STinG 1.20, on my system, do not talk to each other very well when trying to upload queued mail in Newsie.

I am lucky in that my ISP supports SLIP,CSLIP and PPP connections. Before anybody asks the above comparisons were done using PPP with compression both turned on and then off. So, for the time being, I am sticking with STiK (pun intended). If you need PPP then I would try STinG version 1.15 first. Get that working and then try 1.20 and see if you have any improvements.

TT030 connecting with a USRobotics Sportster 33.6 that was flash upgraded to 56K. Connecting through Serial 2/lan port. HSModem installed. Typical connection speeds reported by the modem varies between 48000 to 51000 with both STiK/STinG (either version).

I can't see how publishing such a simple fact as part of a public discussion with you could be seen in any way as a misuse of this data - regardless of whether it came from a database subject to the Data Protection Act.

You can now run Gemulator with ROM images on disk. (Copyright restrictions apply - you should own a legit set of TOS ROMs when using the disk image.) You need the hardware card plus ROMs to do Apple emulation.

No known problems with GEM and Gemulator - any more details on what you heard?

[Declaration of interest: we do the UK distribution of Gemulator, see sig, for RoW see www.emulators.com]

There are adapters avaliable to connect a PC mouse to an ST , one
'manafacturer' is Mario Beacroft who lives in New Zealand. He is also
working on a PC keyboard interface.

Check out his URL

http://www.ak.planet.gen.nz/~mario/

HI gang,

I've had enough of my Pc on the net and are getting kitted out with My Falcon. I have a few ?'s if anyone can help....

1) I've teseted HTML pages in CAB and all seams ok, but will cab support the AVI's and animated Gifs ?

2) will CAB support the Realaudio net sites such as discjockey.com ? (or .ra formats)

3) what about Java and all that for CAB ?

If anones out there using CAB, who has used or is using a PC for the net, what problems do you encounter and what do you think of CAB ?

I'm going to get online on my Atari anyways, but I would like to know the few ?'s I have.

Please mail me direct, thanks

Chris

[Attaching a hard drive to a 1040]
>My two questions are,
>
>1. Which would be better, IDE or SCSI. I've seen alot on both

SCSI is the preferred/standard method. You just have a host adaptor to convert the Atari's ACSI port to SCSI. To use IDE I think you need TOS 2.06, which will add to the cost, and IDE interfaces are much less common. The plus is that the IDE solutions tend to fit inside the casing, whereas SCSI usually involves an external drive.

>2. Which ever one is better, what device would be the best way to
>interface to the 1040 and other St's.

To be sure of being able to use most modern SCSI drives you would be best looking at something like the Link97 adaptor. Older adaptors tend to be limited by such things as parity settings (about which I know next to nothing).

>I did not get any disks with the system, if anybody know a FTP site with
>images of the original disks, that would be great..

The original disks contain almost nothing (unless the machine came bundled in a package with games or educational software). Some machines came with a buggy and crude BASIC interpreter, other than that it was just the control panel: later versions are better anyway. Look for Xcontrol in the FTP archives.

You'll find most of your basic info, including the address of the Atari FTP site list, in the quick FAQ: http://quickfaq.atari.org

Goto ftp.povray.org or http://www.povray.org

They have latest releases of POV-ray for Macintosh, PC, Amiga.

It would be best (quickest) to run the PC native version under
Win95/DOS than run the Atari version under an Atari emulator.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi Louis,

The problems you are having with Sting could very well be due to the
Cache.Dns.

You should not have used your old cache.dns with the new STinG.

I have noticed at times that the Cache.Dns gets corrupted with any
version of STinG.

All you have to do is Delete it. STinG is smart enough to know that
it is not there and will create another one for you.

Heck, I delete my Cache.Dns all the time to keep things cleaned out.
;)

BTW, Here is the Web page where I downloaded the New STinG v.1.20.
http://www.ettnet.se/~dlanor/sting/html/index.htm

Works fine here on the Falcon.

SLIP doesn't really care where it is at. STiNG or MiNT Net should
be able to do this as well as long as they are running SLIP. However the
OS you are using is dependant as well. Magic 6 on my system reinitializes
the Serial port when I restart so even if I were able to keep a connection
up to that point, it is lost there.

Not sure, but you can use a VGA monitor, although in monochrome-only
mode (no games). There are VGA to Mac adapters, so it should be
possible.

> Secondly, is it possible to hook this Atari upto my SCART television?

Yes, if you can buy/make the right cable. Pinouts are in the Quick FAQ.
Again a TV will only give you the colours modes, no monochrome.

So there is still people using the old FDT?
If your computer is an STE then you have room for an additional 512KB of
data
just above the TOS address range. If you have an ordinary ST you can
decode it
to accept a couple of MB:s of data on EPROMs.

Actually I was planning for some kind of a built in terminal progam to
let the
diskless and HD-less old 520STM act as a TTY terminal for Unix and some
debuggung tasks in DOS. It would be fairly portable since one could use
any
TV for screen.

>;)
>

You could be rite, though I checked several of the old files during the probs. Cache.dns *looked* OK... I had this trouble when I started with Sting/Newsie, when Newsie screwed up both cache.dns and route.tab.

Anyway, what annoyed me were the 3 CPX-es that appeared to be corrupt: they're sitting in the CPX dir, but I couldn't open them. Even after a new unpacking I had the same thing. So either the whole file I got was corrupt or something else might have gone wrong. I'm willing to give it another try and then delete old cache.dns, but yesterday I sure was glad I finally got the old stuff up 'n running again after 5 hrs...

BTW: fetched the file from the same site you stated.

Hi all !

Now it's time again for a new MyMAIL version (0.83)

You can download from this address:
http://www2.tripnet.se/~erikhall/programs/mymail.html

You can add or remove yourself from MyMAIL mailinglist.
The add/remove page is found at:
http://www2.tripnet.se/~erikhall/mymailupdates.html
The mailinglist are handled by MyMAIL automaticly.

Best Regards

Erik Hall

There are no registration cards for the versions distributed directly by me. There might be registration cards for the versions distributed by System Solutions. In this case you have to send your card to Systeom Solutions. Or, if you want me to send you an update, you have to send me the update fee with your original floppy disk (once) in order to become a registered user.

Hi Pat,

well, this morning gave it another shot. Appearently three CPX-es from the archive appear to be corrupt over here: Internals, Stingport and Stingprot. They simply won't open up in either Freedom or the old Control panel. Perhaps even more files are corrupt, can't check it because the stuff simply won't work, although Sting reports normal at boot. The dialer won't come in because Internals cpx cannot be set to "active".
I ran into exactly the same trouble as yesterday but since I know what's happening it took me only 5 minutes to reconfigure my modem :-) Somehow the whole setup is screwing my modemsettings too, I have to go to a terminalprogram to get it set OK again.

Now I can go back to the site and fetch the complete 400k again, just to hope I get the 3 cpx-es in OK this time... Funny thing is that I get no CRC-errors on the file, not at unpacking either (did it another time to be sure). So what's up, since Phantom used the same archive without probs???

>programs/platforms.

The only "fancy" option added I found is a new box to select autamatic dns ip-address request.

The STinG uppgrade actually works better on my setup. Used to have problems to initate the ppp link to my provider sometimes. The new version has not failed at all sofar.

Got bus-error once when hanging up in the Dialer. This also happend sometimes with the old version.

When Dialer is set to stay resident when last window is closed I can't anymore reopen the main window. Had to force termination in Geneva to end it. This used to work in the old version.

When initating the local ppp link to my pc the old stingprt.cpx would sometimes hang. Not seen (yet?) in the new version.

Sometimes the old version would hang on my router computer under heavy load from traffic to the other computers on my LAN. Has not happend with the new version.

When dialing under remote control from another computer the old version returned wrong result codes. This is still present in the new one.

When installing the new version I had two minor problems:

As no dummy stx modules were included in the new package I left the old ones in by misstake and got bombs.

"Request Name Servers from remote" was not checked in the Dialer configs using the old DIAL.SCR

The other reports that "It does not work at all anymore" seems to to with that they have put in a new (not updated) SERIAL.CPX and forgot to

set up the serial ports correctly?

I really think the update was worth it. Ronald Andersson really has done a great job in the abscence of Petter Rottengatter. Not an easy task as he does not have access to all the source code.

Freek Munniksma a ï¿½crit dans le message <7f0206pmt1@news1.xs4all.nl>...
>Today i read an article in an old ST Format issue about an operating system
>called SMS2 for Atari .It came as a cartridge to be plugged into an
ordinary
>1040.Itï¿½s supposed to be multitasking and lightning fast and related to
Unix
>and VMS.
>Does anyone know anything about this? Can the code be downloaded from
>somewhere and possibly be loaded from HD?
>
>Greetings,Freek.
>(Thats my real name :)
>

Yes I know well what this was about.

SMS2 was a version of what we call now SMSQ/E.
It is a compatible operating system to the Sinclair QL's one
which was already very advanced for its time (1984,
preemptive multitasking, very fast, very small).
For various reasons, the people who introduced SMS2 had
to stop.

It is not UNIX! The basic algorithms in there are much more
efficient than in UNIX. It is pure performance.

Today there are still not many commercial systems based
on the original technology developed in this OS. One has
some success and is a threat for WinCE, this is EPOC from
Psion (see http://www.symbian.com if interested).

The good news is that SMSQ is still being developed by its
original author, and that it can be bought for the Atari ST
platform. But beware: it is a system for freaks (so you
maybe interested?!). Incidentally Linus Torvalds used
the Sinclair QL for some years, but he did not really
understand why it is is more advanced)

To get some informations you can go and have a look at

http://wwwusers.imaginet.fr/~godefroy/

In there follow the link to Jochen Merz Software who sells
SMSQ/E.

If you want to join us (we are about 1000 to 2000 left and
about 200 in Internet), then there is an active mailing list

where you can ask your questions.

For the more technical minded of you, at above URL there are
explanations about why the QDOS/SMSQ environment is
more efficient and easier to program: see Stella. But beware as
it is quite advanced stuff. To understand it is best to have taken
some lessons about computer programming in a concurrent
environment, and then forget what you have learned!

Sincerely from France
Arnould

I had a talk with System Solutions at the AMS show on Sunday about the
flickering pixel problem. Apparently it can be an issue with the particular
adaptor board as well as the speed of the RAM itself. The ActionSoft board
is alledgedly one that has a problem (and guess which one I have!) The fix
is to change back to the original (as you've said) or ignore the visual FX
which are otherwise harmless.

There's a file around on the Net (I'm sure that the author will come forward
with the address!) which describes a home-made version of the Screenblaster.
It's a TTL oscillator fitted internally which I'm sure will help. Best thing
is that there is no track cutting!

1234. FS/T: Atari ST games [04/19/1999]

Newsgroup: comp.sys.atari.st
Date: 1999-04-19 00:00:00 UTC
From: VideoGameAdvantage@DittosRush.com
Message-ID: <3726b6f4.499594@news.nls.net>
Source record: 80493

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 04/19/1999

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection is currently on-line! Unfortunately, there is no
list for this system (cartridge and CD based systems only).

I have the following Atari ST software for sale or trade.

Unless specified, all items are *NEW* and are still shrinkwrapped.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped! Includes box and manual]:
$ 4.00 Art & Film Director (Epyx) -- $4.30 shipping, due to
weight, counts as 1st item
$ 3.00 California Games (Epyx)
$ 3.00 Death Sword (Epyx)
$ 2.00 Devon Aire (Epyx)
$ 2.00 Dragon Scape (Free Spirit)
$ 2.00 Final Assault (Epyx)
$ 3.00 GFL Football (Gamestar)
$ 2.00 Lands of Havoc (Antic Software)
$ 2.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 3.00 Metro Cross (U.S. Gold / Epyx)
$ 3.00 Paint Pro (Abacus Software)
$ 2.00 Prime Time (First Row)
$ 3.00 Quadralien (Spinnaker)

$ 3.00 Renegade (Taito)
$ 2.00 SwiftaR (Accustar)
$ 3.00 Techno Cop (U.S. Gold / Epyx)
$ 4.00 Warship (Strategic Simulations, Inc.)
$ 3.00 Winter Games (Epyx)
$ 3.00 World Games (Epyx)
$ 3.00 World Karate Championship (Epyx)

SPECIAL: Buy one (1) of each listed title and receive 20% off.

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.20 for the first game and $1.10 for each additional game. Shipping for hardware and accessories depends on the distance that the order must travel. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside

the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

Hi again,

well, my free monday means another day with computerproblems. I could have gone to work and experience the same, with PeeCees... :-(

So I fetched the Sting1.20 file once more, this time parked it onto a non-LFN partition (the first time it went to a LFN-partition) and extracted again. No probs. Put everything where it belongs once more, did a reboot and I got to the 4 CPX-es alrite. After saving settings in the Internal cpx however it got corrupt again, I couldn't open it anylonger. Anyway, got it set to "active". Sting simply wouldn't run, or better said: it loads, then the Dialer got active once I set the cpx to "active" but no go to my ISP. Same shit, pinging it got stuck after 15 datagrams came back.

So I shoved back the old files from Sting 1.15 and 1.12 and after that the whole bunch was screwed again: this time the ping to my ISP went fine, but the ping to my own machine did nothing! Checked every bloody file that has to do with it, everything 100% OK, no corrupted route.tab or cache.dns...

Then created a whole new Sting directory, the old one was pretty much messed up with all kinds of temp dirs, so I got a nice 'n neat clean Sting dir where the Dialer sits in too etc. etc. etc., rebooted and the ping to my own machine refused to get stuff back in. Strangely enough, the ping to my ISP went 100%....

Finally reconfigured the modem to AT&R1 and use that in the start-up config too and finally things were back to normal. Note, this one's combined with AT&K3 here. Now it works, on the old Sting 1.15 with the TCP.STX from an earlier version and it runs 100% OK again. I *think* I noticed a slight speed increase too.

BTW: The whole 1.20 upgrade goes into the can, I don't need this kinda shit. Others may perhaps say "it sure is the MagiC OS you're running"; well Sting 1.15 is running 100% here, I don't have these 30 sec delays others are experiencing, so for me it doesn't have to be upgraded.

I must add, that I upgraded my Okami yesterday, it looks like this one flies on the import/maintain stuff.

Also I upgraded the Mintkernel to 1.15.1-0.9 (not the latest beta) and it runs without troubles too. Still have to go to Mintnet 1.03 (I'm still on 1.01 here) and the later minix.xfs stuff... but for now I've been upgrading more than enough. Let's just try to keep this machine *working* for a while... :-)

> attempting some sort of support...:)

This last statement I cannot believe, since I have seen an Atari run Macintosh software faster then a much more expensive and 'powerful' Macintosh of the same era. Atarians need to realize that they should never say never, because as soon as you do, boom someone goes and does it. The first implementation may not be fast, and may not be pretty but eventually it will evolve in to a usable solution. A primary example is ARC on the 8-bit Atari.

Technically I don't see why not, other than it's 1.62, not 1.63, and that it
might run on a mega STE.

```
Try plugging in some old roms from an STE and see what happens before
designing a TOS switcher board.

>with a 56K modem on a Falcon. Maybe not?

The connection speed to the ISP is really nothing to do with the Falcon or STinG, it's more dependent on the quality of the phone line and how well the two modems at either end get on. If you get a connection speed of more than 33k then the extra 56k stuff has kicked in automatically, it just can't go any faster due to the phone connection.

Only solution is to have your line checked, I guess. If it cheers you up any, my K56flex modem rarely connects at faster than 40k, usually it's 38k like you. I believe that people tend to average higher connection rates with V90, but again it's still dependent on your phone connection.

I'm pretty certain that a MegaST(E) keyboard is plug-compatible with the TT. We've made up adaptors that allow a Mega ST keyboard to be used with a Falcon and I'm sure I've used an STE keyboard in a Falcon.

Ah so that's the problem. Indeed it did seem to be able to write
something small before going haywire.

>
>If you got the high density upgrade from TUS, there should have been a
>small program on the disc supplied that sets the seek rate to 6ms. If
>you haven't got a copy of it, mail me and I'll send you one that does

Umm.....Actually TUS did supply the program but I deleted from the Auto
folder as I thought it was no longer needed when putting in MagiC. I
then lost the original disk. I assumed that it was something other than
the TSUDRVA.prg anyway hence the question.

Thanks to everyone for all the help and ideas. (Thanks Kevin for the
program). Just one comment it was very touchy about it's position in
the AUTO folder. First time I put it in the keyboard played up, once
relocated further up everything behaved perfectly.

Hi, I do similarly long-winded things with my PC and Atari - the PC's great for fiddling with samples but I won't let it anywhere near my MIDI setup.

A tempo lock might by a control message at the beginning of the MIDI file. Once imported into Cubase check the 'grid' editor and have a look for any control messages effecting tempo and delete them. Otherwise, eh ... weird!

> between Java and Javascript.

Well, if you simply check facts and rule out "opinions", you'll see that JavaScript and Java /are/ completely different at the technical level. That doesn't mean that Java Applets and JavaScript cannot performe similar tasks, though, but it's still a bad idea not to distinguish between them. Or would you agree that busses and airplanes are essentially the same, because you can use both to get from, say, Los Angeles to Dallas?

For Java, you need a "Virtual Machine" that interprets (some also do a on-the-fly translation to the native machine language of the computer the Java code is running on) the compiled Java programs (the so-called bytecode). This eats a lot of CPU power, so one shouldn't expect accetable performance of Java programs or applets on Ataris with less than a 68040/33. Furthermore, (AFAIK) noone has yet ported the AWT and its successors, which effectively means that there's no way to use Java stuff that uses windows and dialogs.

For JavaScript, you'll just need an ASCII-based code interpreter, not a complete virtual machine. Thus, JavaScript (or ECMA Script, as the standard is (going to be) named to stop it from being confused with Java all the time) requieres less computer power, but is limited to being used in websites for stuff like online-checking of fields in forms (which is OK as long as the form works without it, too), or for more annoying things like these windows with banners that open from time to time when you visit certain sites.

For those who want to get more - erm - details: Post the question "Java and JavaScript are essentially the same, right?" to either comp.languages.java or comp.languages.javascript ...

Ciao

Thomas

I have an Atari 1040STfm w/1MB RAM and TOS 1.00, an Atari SF314 DSDD FD, two SC1224 RGB monitors (one is cosmetically challenged) and three Atari mice. All of this works just fine, I simply have lost interest in it and hope that someone out there can benefit from it more than I can.

Yes, I will sell particular items seperately, best offers by 4-27-99 will decide.

I also have a spare power brick for a 520ST.

Thanks!
Louis

> I don't understand. JavaScript has nothing at all to do with Java. Java
> and JavaScript are totally different things.

According to a website that I am getting Javascript examples from (to learn
Javascript hopefully!), Java and Javascript are similar in some ways but not
in others. Here is the breakdown of the similarities/differences...

Similarities:
-Javascript supports -most- Java expression syntax...
-Both Java and Javascript cannot write to hard disks...

Differences:
-Javascript does not have strong type checking as Java does, ie...variable type
in Javascript does not need to be declared, Java variable type needs to be
declared...
-Javascript is based on a small number of data types representing numeric, string
and boolean values...
-Javascript code is integrated in the HTML files, and is interpreted (not compiled)
by the client. Java Applets are separate files from the HTML files, and
consist of
compiled bytecodes downloaded from WWW servers and executed...

There we have it. It still doesn't mean much to me but Javascript seems easier
to do
because it doesn't need compiling, just add it to your HTML (means I can
easily make
Javascript on even an ST (Falcon in my case). I still need to borrow Mum and
Dads Mac
to view the Javascript in action tho'... :(

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

If you are lucky, an old PC might be able to read them, but the only other
way is to get them read by a real Atari. Try finding someone in your area
who has one and can copy them onto plain DOS disks.

I have tried 1.20 again. CAB 2.7 seems to be working a little faster,
NEWSie runs smoothly too - as long as I don't try to return to my
desktop and start another client (I'm working under single-tasking TOS
1.04). Also I can't start NEWSie from within CAB. Just simply quiting
a client and/or hanging up my modem without having to reset my
computer gave me trouble sometimes.
Thus I have reinstalled STinG 1.15 again, and everything is back to
normal.
Still, if STinG 1.20 is a potential improvement then I would like to
benefit from it. Am I doing something wrong? Maybe my single tasking
setup should be replaced by MagiC?

(I hate all those installing procedures. When I first started with the
Atari ST everything was like "userfriendly" is supposed to be: TOS in
ROM, program (set to auto-start in a desktop.inf file) on one single
floppy disk. Disk in drive. Start computer ... and YES ... the program
runs ! 10 years ago Plug&Play REALLY existed !
My brother, a professional musician who nows NOTHING about computers,
operating systems, or installing procedures still uses CUBASE this
way. It's the only thing he needs. He doesn't even know how the Atari
desktop works - he never sees it..)

No, no!! You need to have a proper CPX-handler to deal with these. You
can try XCONTROL, ZCONTROL, COPS or even FREEDOM2.

CPXs are not like AUTO-progs - they are more like ACCs.

1277. STinG and Modem Connection Speeds

Newsgroup: comp.sys.atari.st
Date: 1999-04-20 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7fhab9$29l57@news.ajou.ac.kr>
Source record: 80371

Ever since I upgraded to a 56K Modem. I have been wondering
if I am getting the most speed out of it.

Well the other day I changed my Dial Script in STinG to allow
the modem to ISP connection speed to be shown.
And much to my suprise most of the time I am getting
connected at 24000, every now and then I'll get a
26400 connection. This does not seem right. I'm thinking
I should be getting at least a 38400 connection or better
with a 56K modem on a Falcon. Maybe not?

Any way the modem is a Hayes Accura Speaker Phone 56K-Flex modem
and the ISP also suppose to use K-Flex.

Is there sometype of Universal Modem Commands that I could turn
something On or Off on this modem that may help get a faster
connection?

I've not messed around with modem commands that much since
I use to turn the Flow Control off of a Good Ole Zoom 14.4
modem to allow it to work at 19200 on a ICD Multi I/O
equipped Atari 8-bit.

I did get a list of the AT commands and etc. off of Hayes Web
Site. One of the reasons I bought this modem was at the time
Hayes had a very good rebate offer on it.

Well, I never got my Rebate back and the last time I checked
Hayes Web Page they had filed for Bankruptcy. That Figures :/

Hi

I use a program called DC Format v3, to add the MS-DOS bits on any disk
from my ST's. Windoze can't seem to format single sided, but can read
one.

Actually using CD Format you can have use an extended format and the PC
should still be able to read it; as long as you make it MS-DOS
compatible;)

I can do it for you, taking for granted you are in the UK, and not
Kathmandu;)

This is wrong. Of course a Java application can.write to hard disks. An
applet can't, a normal Java application can.

This web site doesn't seem to be very useful. The differences between
Java and Javascript have already been explained here and are tremendous.

No it's very difficult to upgrade. Requires soldering and an expensive
upgrade board

> e-mail please thank you sfpu@scfn.thpl.lib.fl.us

NO! Newsgroups are not a write-only media. If you can't be bothered to
come back to read the answers, then don't post.

> the AVI's and animated Gifs ?

Avi's with aniplayer, but I don't think they'll be embedded. Gifs will
be fine.

> 2) will CAB support the Realaudio net sites such as discjockey.com ? (or
> .ra formats)

Nope. There is no .ra decoder for the Atari, partly because the spec is
not published.

> 3) what about Java and all that for CAB ?

No. Never. Don't even dream about Java on anything less than an 060 with
32Mb. JavaScript maybe, it has been announced as part of Draconis, but
that is still vaporware of the most ethereal kind.

> If anones out there using CAB, who has used or is using a PC for the net,
> what problems do you encounter and what do you think of CAB ?

1.5 is sloooow. Printing is out of question, and there is no support for
frames. CAB 2.7 speeds things up a bit, has some neat little modules and
supports frames.

> I'm going to get online on my Atari anyways, but I would like to know the

1285. Re: MC68882 price?

Newsgroup: comp.sys.atari.st
Date: 1999-04-20 00:00:00 UTC
From: lvzon@bio.vu.nl
Message-ID: <7fhhja$9ej$1@feresa.bio.vu.nl>
Source record: 80379
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I was wondering...
What's the deal with the pins on the 68882?
Most of these seem to have the pins below the chip. OK, I can understand
that, it's easier to plug in, harder to destroy and looks niver as well.
But the FPU-socket in the Falcon seems to be made for chips with the pins
coming from the side. Why? Is this for 68881 compatibility?
Coz' it seems to be almost impossible to get a (second hand) 68882 FPU
that will fit into the bloody socket!

1289. Question: Recycle midi file to Atari Cubase

Newsgroup: comp.sys.atari.st
Date: 1999-04-20 00:00:00 UTC
From: shimh@clpgh.org
Message-ID: <7fhtfn$gv1$1@nnrp1.dejanews.com>
Source record: 80383

Hi all,

I recently acquired a low end powerbook to do Recycle and other sound editing programs to use with my MIDI setup based on an ST running Cubase 3.1. I usually save my Recycle midi files to a sequencer on the Mac and save on to a PC disk then load from this disk to Cubase on the good ol' Atari. Despite the long winded process it works great. My only concern is once the files are loaded Tempo seems to be locked and any attempts to change it goes back to the original tempo. How can I fix or at least work around this problem? Thanks.

It depends on the upgrade board. Mine required no soldering that I can
remember... it was just a push-in board that let me use up to 4-1 Meg
SIMMS.

I think they must be totally different to the ST's keyboard:(

Just a thought that should get you through a while would be to use a
clip from the LEAST used keys; e.g. from your number pad keys! At least
you should be able use a space.

If I come across a keyboard I'll let you know;)

I need to tell you that Javascript in Draconis is a reality since the last
so-called "Atari-Messe" (Atari-Show) at Neuss.
This means you could buy a javascript-capable browser since 10.4.1999.

Greetings

Sacha / Stefan

If this is an ST program where can I get it. While not a Windoze utility it will probably solve her problem (she is now using a WinTel computer and does not know if her old ST is still usable). If it is still usable, just Zapping the Disks will save lots of time in trying to read them and then trying to port them to the WinTel by Email [or ZMODEM via a Null Modem Cable].

IIRC, there was a program that you put in the auto folder on a floppy disk called coldboot or reboot, that would pause for like 30 seconds then reboot the computer.

Another option is to turn on the HD first, then the floppy drive then the monitor then count to 5 and then the computer.

Nick,

Okami's not only for Mint systems. Tho' the config files have a lot of
stuff related to Unix-style systems, it runs perfectly on MagiC and I
guess TOS or whatever OS.
What U want is how I used to run Semper: leave it idling/running and the
whole process of connecting, fetching, importing, exporting, crunching
went automatic. It was set to connect twice daily, one time at 0400 hrs
and the second time at 1800 hrs. I only had to open the reader to read the
stuff... :-) alrite, write the replies too...

Now the Sting bunch is another story: it could be possible with script or
batchfiles, dunno, I'm not into that kinda bizness too well myself.
As far as Popwatch is concerned: you first have to select what mail you
want to fetch, so there's problem nr. 1.
Maybe Okami can be set to do a lot of stuff automated, it does handle ISO
8859x stuff, but again I'm not sure about "automated functionality".

FireNews problem is that it can't handle UUE and MIME stuff.

Amail problem is that it can't handle *selected* mail.

MyMail can be set to retrieve all mail, but can it do it automated?

Sofar I'm real happy with Okami, I need to launch it manually, also launch Newswatch and Popwatch manually, they both need clicks to get to work and I have to be there and issue the "clicks" :-)

I use it for news and mail, it's perfectly doing its job and I use Newsie only for online newshandling, like binary groups. It does that perfect too.

As long as aMail can't handle selected mail it's out of the question for me. Same with FireNews as long as it can't handle UUE/MIME. I use MyMail occasionally just to evaluate it during its evolution :-)

What you want is something I would like also, but I figure we're a long way from that kind of options...

1302. Re: Atari Software

Newsgroup: comp.sys.atari.st
Date: 1999-04-21 00:00:00 UTC
From: jim harris <jim@studio9.demon.co.uk>
Message-ID: <371DA364.CECBF800@studio9.demon.co.uk>
Source record: 80246

yup, you need a herd of commercial programmers with the following CVs

intel chip series assembler,
C/C++ under DOS/Win 3.x/Win 9x,
motorola chip series assembler
C/C++ under TOS/GEM, MultiTOS, MagiC
a willingness to work for little or no money

;)

perhaps you mean Atari software ported to a PC based TOS/GEM emulator? In which case yes, save out software to an IBM formatted 720k floppy within the emulator environment.

Or?

Atari software you've downloaded from the net on a PC. Same again just copy from PC's hard drive to IBM formatted 720k floppy (or Zip formatted under HD Driver, which creates a TOS/DOS compatible disk). Careful tho as I've had problems with encoding. Under Windows it's best to do a shift and left click on link to save it - that way straight to your hard drive and Netscape/IE wont mangle it.

1303. Let's exchange our Sharewares !

Newsgroup: comp.sys.atari.st
Date: 1999-04-21 00:00:00 UTC
From: Jean LUSETTI <j-lusetti@pacwan.fr>
Message-ID: <7fk9t5nju2@news4.isdnet.net>
Source record: 80247

Hi everybody !

Like me, perhaps you use some Sharewares but you don't think it's worth a registration.
Like me again, perhaps you are the author of such a Shareware.

Here comes the idea:
Let's exchange our registrations !

I've already done that with Thomas BINDER, the author of Thing. He said that even if he won't use very much VISION, he agrees the principle of the exchange.

So I propose to every Shareware author who is interested by VISION to simply exchange a VISION registration key with a key for his own Shareware.
This exchange, let's name it SharewareExchange, can follow this rules:

1. Every Shareware author can propose to every other Shareware author such a SharewareExchange
2. Every Shareware author can refuse such a SharewareExchange
3. To proceed the exchange, we can adopt such principles:
[1] A, an author of a Shareware proposes to B a SharewareExchange
[2] If B is interested, he send his agrement to B
[3] A send his registration key to B
[4] B send his registration key to A
4. The SharewareExchange is normaly valid only for the current versions of the two Sharewares. But the philosphy of the SharewareExchange recommends that it is also valid for future versions. Each author can send or ask for the new key. Please note that this is not an obligation but only a recommendation.

Some comments:
1. --> Seems to be basic !
2. --> Logical ! If B is not interested by the other Shareware or if he think this is bullshit, he can refuse ! The prices of the two Sharewares may also be VERY different... But note that the SharewareExchange is more based on an exchange of persons who want to share softwares than on a money exchange.
3. --> All these responses and proposals can be done via E-Mail
Note that B can send his registration key at step [2], if he has sufficient trust in A.
4. --> Of course, if one of the two Sharewares ends, the other author is free to stop or continue sending him new versions.

If this works well, we may create a SharewareExchange WebRing, and why not propose to exchange Sharewares between other machines.

Ok, that's all, thanks you for reading. I hope I was clear !
I promise to study every proposal.

See you, Jean

>come across it on the ST on the 8-bit!

"A Day at the Races" (ADAR) was done by a company named TEAM Software
which is defunct now. ADAR was only done for the ST line of Atari
microcomputers.

ADAR is now offered as shareware and should be obtainable at
Atari archives as well as http://melake.erols.com/~atari or
ftp://melake.erols.com/pub/Atari

Atari's own program was NoRoach. It writes a special bootsector on your
bootfloppy that blinks a Roach (or any icon you loaded) at bootup. It's
found at UMICH, among other places.

Message-ID: <371dcf15.84056322@news.northrock.bm>
Source record: 80250

Thanks for the information.

Thanks for the information.

Roger at Line Audio was very helpful with this problem.

I have a few questions concerning the Soundpool board exchange:

Did they give you a brand new board or did they just upgrade the old
FDI board?

Did you have to send your board first,or did they send you their board
first? 6 weeks is a long time.

Roger at Line Audio said the reason why the JAM 8 does not produce any
sound is because of the termination resistors that are just below the
DSP port.

He said it places too much of a load on the DSP circuit,and in return
causes the JAM 8 outputs to either be swapped randomly or to not sound
at all.

He also said to be careful with the upgrade because,
you are not guarenteed to have the termination resistors removed,so
the Audio out problem with the JAM 8 may still be there.
The newer Soundpool SPDIF units do not have termination resistors next
to the DSPport.

It seems like Soundpool designed their unit to only work with the
FA8/FA4 units.They kept recommending that I buy their 8/4 output unit
to rectify this problem.I probably would have if it had balanced outs.

Thanks for your Help

Strange all those problems with Sting 1.20. After a (recursive)
backup of the old setup I replaced all the old files by the new
ones. Only had to change the serial CPX (speed/port) setup . It took
my aprox. 10 minutes to get back on the net with this new setup in
spite of not being a computerwizzard ;-). Oops I almost forgot: I had
to rename the dialer prg from dialer.acc (as I happen to use it that
way ;-) to dialer.app after noticing it could only be run once as an
ACC.
I believe we have almost the same TT setup (MagiC 5.04 Thing, Okami
Newswatch, Popwatch and NVDI 4.1) it must be Freedom or something. I
use Cops. As for the results:
Newswatch: CPS approx 3600, was 3100
Cab 2.5 : seems to be a little bit faster
Aftp download not to much difference.

SU Bram

The way I have been using STinG with different ISPs is to create a
folder in the Sting folder called Scripts and then creating a
different Dial.Scr and Default.Cfg for each ISP I use.
Then after booting up I copy the dial.scr and default.cfg for the
ISP I want to use into the proper folders inside the Sting folder.
Then click on Active in the Sting Internal CPX. Load the Dialer.App
and away I go. Have had no problems doing it this way.
But I don't have any other programs hooked into STinG, Just a
Basic setup that allows me to run stuff like Cab, Newsie, AFTP,
and all the other goodies.
This works fine with plain Tos or Geneva, not tried it with other
OS's, maybe Mint soon. ;)

If you do it like above it may tend to corrupt your Cache.Dns
from time to time. I Just delete it if I see or experience a
problem which is very seldom. STinG will create another one for
you. ;)

I have never tried using STinG as an ACC.

>The trade off is the video bandwidth, go for a lower colour range/screen

I plan on getting some type of acceletator for the Falcon soon.
Was going to try re-installing the Nemesis, but am going to wait
and see if the CT2 ever makes it over here in the US.

I have the ScreenBlaster 2 external Hardware that allows some nice
resolutions on a stock Falcon. I tried 1280 x 960 in 16 colors with

STinG 1.20 at 57600 and it does work, but it seems a bit slower than
38400. I'm pretty sure it's due to a lack of a upgrade accelerator.
800 x 600 in 256 colors at 38400 works fairly well but is not as
fast as 640 x 480 in 256 or 16 colors which is fast.

>Basically the remapping facility was to allow you to use speeds over 19200

Hi Uwe,

I didn't get HD Driver directly from you. But I think it may be better
for me to send you my original disk along with the update fee.
That way I would probably get the latest version.

If I send you my disk and the upgrade fee in cash, USD by Global
Priority Mail, would this be alright? Or do you require the fee to
be in another currency other than US dollars?

And what would be the total fee in USD to upgrade to the latest
version of HD Driver?

Also Uwe, I wanted to ask you if any version of HD Driver removes
the limited size of partitions when using FalconSpeed.

I have a FalconSpeed 286 board with version 6.2 of the software,
which allows the use of TOS partition sizes up to 128MB under DOS.
According to the v.6.2 documentation, if you have a internal IDE
hard drive of less than 100MB then you cannot use partitions with
more than 64MB allocated under DOS.
Also according to the Docs, it is safest if the DOS boot partition
C doesn't exceed 32MB.

My previous setup with FalconSpeed included a internal Conner 85meg
hard drive partitioned into 4 partitions of around 20megs each.
Partition C: was TOS Boot, D: was a TOS partition, E: was DOS Boot,
and F: was another TOS partition.
This is how my Falcon came setup along with Ataris Hard Drive
software.
I then added a 540meg internal SCSI drive to my Falcon and created
4 to 5 partitions on it with Ataris software. 3 partitions were
around 100MB each, so that I would have compatibility with DOS
software on them.

This setup worked fine, no crashes, always stable. Until I started copying and moving around large files of 3-4 megs or more. My SCSI hard drive started doing resets when moving, copying very large files. I then switched to HD Driver 6, which solved this problem. I have never had any problems with large files since. I had a older version of Ataris Software which must have caused this problem. I think it may have been fixed in a later version, not sure on that.

FalconSpeed worked fine with HD Driver 6, the only problem I ever came across was that I could no longer see the files on the DOS Boot partition E: while using TOS. The DOS boot partition would bootup just fine though and I could see the files on the DOS Boot partition while in DOS.

At the present time, I don't have FalconSpeed installed. And have removed the 85meg IDE and replaced it with a 540meg IDE, then replaced that one with a 6.4 Gig IDE and have added a 1 Gig SCSI along with the 540meg SCSI.

Now, I would like to install FalconSpeed again. I have noticed that there have been many changes to HD Driver since version 6. I think sometype of program called BIGDOS was introduced for larger DOS partitions? Not real sure on this.

Would you happen to know if it is now safe to use any size of a DOS Boot partition with FalconSpeed on any partition of a internal IDE using a more recent version of HD Driver? If so, is it also safe to use larger TOS partitions over 128MB under DOS?

Since 2 IDE drives can be used with HD Driver, I thought about installing the old 85meg IDE along with the 6.4 Gig since it is already setup with DOS. But I'm not sure how FalconSpeed would react to another IDE drive.

Or, it might be possible to setup a DOS boot partition on one of the SCSI drives. But the problem I see is this limit with partitions. I am almost positive that somewhere in the FalconSpeed Documentation it states not to use TOS partitions larger than the DOS Boot partition Before the DOS Boot partition. I know you can have larger TOS partitions after the DOS Boot partition.
So I am confused on this, I'm not even sure that HD Driver would make any difference on the partition sizes when it comes to Falcon Speed. I know that HD Driver does allow up to 1 Gig partitions on the Falcon, which is great. I am confused as to why there is a limit with the DOS Boot partition and TOS partitions when using FalconSpeed.

If you can make any sense of all this and maybe offer some advise I'd sure appreciate it. My Goal here is to be able to use FalconSpeed without having to use alot of small partitions.
And have a good stable drive system.

Thanks in Advance for any help,
Phantomm

Interesting, as Red Rat software was responsible for some high quality software, especially for the 8-bit Atari user. I also assure you that A Day At The Races was first released for the 8-bit market.

I know as I paid for it before it was released, and was sent it when it was released;)

And if my memory serves me right, they were from the Manchester or Liverpool area (could be wrong though), they were based in the UK.

They did start producing software for the ST, Lombard RAC Rally comes to mind. So it wouldn't surprise me if they did release it for the ST.

The came alive producing quality software and a budget price. They also were responsible for Push It, or is it Shove It!! It stared Quavers star Curley Colin;)

>

Sorry Jo but Olga works very fine with MiNT/N.AES. MagiC isn't needed at
all. It even runs with Geneva/Thing.
Running Olga at boot? Strange way to use it.
With MiNT and N.AES you only need to install the enviroment variable OLGAMANAGER in
n_aes.cnf. It looks something like this.
From n_aes.cnf: export OLGAMANAGER=h:\olga\olga.app
From gem.cnf (multiTOS, Geneva) : setenv OLGAMANAGER=h:\olga\olga.app
From magx.inf: #_ENV OLGAMANAGER=h:\olga\olga.app

Furthermore you need to edit olga.inf:
It must contains lines like this

```
[Extensions]
.HTM=$CAB
.AVI=$ANIPLAY
.MOV=$ANIPLAY
.QT=$ANIPLAY
.FLI=$ANIPLAY
.AVR=$ANIPLAY
.WAV=$ANIPLAY
.AIF=$ANIPLAY

[Objects]
.AVI=Video For Windows
.MOV=QuickTime Movie MOV
.QT=QuickTime Movie QT
.FLI=Autodesk Animator Movie
.AVR=Audio Visual Research
.WAV=Microsoft RIFF-WAVE
.AIF=Apple Interchange File Format

[Applications]
ANIPLAY=F:\ANIPLAY\ANIPLAY.PRG
CAB=D:\BROWSERS\CAB_270\CAB.APP
```

Hi Bram,

In fact I didn't need more than those same 10 minutes to set it up again.
The hours afterwards were needed to figure out what happened and why the
original setup didn't work either any longer... :-)

I recall my upgrades from 1.08 to 1.10, then 1.12 and then 1.15 didn't
take more than 10 mins either.

It could be Freedom; then I'd choose to keep Freedom combined with Sting
1.15. It runs flawless. Perhaps 1.20 would squeek a few more bps out of
the modem, but hell...

Speaking of bps: I still use an old 14K4 one, Newswatch usually fetches
with an average 700 (as indicated), Newsie runs at 1600-1650 on long files,
Cab usually states 1400-1500 on a good connection, with exceptions that
some files or archives run at 1800 and even up till 2200 bps - for an
extended period of time, that is.
aFTP gives me filetranfers averaging around 1400-1600, while aFTP on pppd
reaches even higher speeds.

Speaking about bps-2, I think I'm gonna switch my modem for a 56K one. Got
one question: since I blew modemport-2 (my own stupid fault, one shouldn't
plug a modem hot) I am just wondering whether or not the two serial extra
ports and the LAN port will work OK or not? Perhaps they share the same

controller and are now gone too?

I have some atari files that I downloaded off the net and they run using an
Atari emulator. I think thegames are usually best when played on a real Atari.
I just save the file directly to an IBM formated 720k floppy and it will work?

Will this Emoe execute the line_f floating point instructions native on a appropriate pentium? That would give it a big advantage over most other emulators.

Henk.

>My brother, a professional musician who nows NOTHING about computers,
>operating systems, or installing procedures still uses CUBASE this
>way. It's the only thing he needs. He doesn't even know how the Atari
>desktop works - he never sees it..)

Martin, as long as you use the ST for Cubase only: no probs.

As long as you only use FirstWord Zero (you know, that fine program with no WYSIWYG and when you wanted a print: quit/start up print.prg/then change a letter so/quit print/start FirstWord Zero/etc) it's no problem either.

The trouble is: on our 10-15 years old machines we want multitasking, hi-rez many colours, click-'n-go-to-the-right-software, objectlinking, drag 'n drop, installed apps, just name it.

Well, Microhard Inc. uses the Wizard for all this: one small problem and there's only one solution: re-install, you never know where to look for whatever config file.

Even with this Wizard Wizard you'll get conflict reports, since Win-95 doesn't know about a G200 gfx card and thus reports a conflict between Ethernet and graphics cards operating in each others memory, which in fact isn't true but meanwhile when quitting Win while in the network it won't shut down properly and the next time it takes extra time to set it up properly. Not to speak of the sometimes endless hanging machine...
(Sorry Ronald, I got that virus too, or could it be a cat balancing on my spacebar, tipping one leg on the dotkey?)

Gee, I'm glad that (most of the time) I know WHERE I have to look for messed up files on this complicated system. And when I install something myself, at least I know what's put where and when (again: most of the time).

Yup, I've got a machine like a Ferrari for looks, a Mercedes for comfort (well, the Economy model), the problem is it's powered by a Skoda engine...

About time this Phenix with 2x060 rolls out!

...and folks,...beware...of...the...bloody...CatVirus...!!!

I totally agree. If you want the best available for the Atari, don't get put off by the setup files.

<snip>
>Now the Sting bunch is another story: it could be possible with script or
>batchfiles, dunno, I'm not into that kinda bizness too well myself.

STinG's login batch facility by itself isn't OK for this kind of thing: it's meant to launch programs sequentially so only works with things like the time setter program.

However, IIRC Gary Priest has done a program launcher which you can use from STinG's login batch which will launch several programs at once, ie POPwatch, NEWSwatch, whatever. Disconnection *may* be a problem. One way would be to use your ISP's timeout so it disconnects you after so many seconds of inactivity. This is dodgy, though because if it doesn't work for any reason you'll have a huge phone bill...

It might be worth investigating options with the STinG's dialer's remote control, but you might need a program writing. Something you could call after everything else you've launched that monitors connections and hangs up if there are no active ones after a given period?

>As far as Popwatch is concerned: you first have to select what mail you
>want to fetch, so there's problem nr. 1.

You can set which mailbox/config etc to use, plus send/receive and connection options by launching it with command line switches, IIRC. Ideal for this purpose. NEWSwatch has similar command line options.

>Maybe Okami can be set to do a lot of stuff automated, it does handle ISO
>8859x stuff, but again I'm not sure about "automated functionality".

You could possibly run a batch file after hangup to do the import stuff. If you are already using a batch file for that (maybe incorporating kill

functions etc), you'd "just" need to call it.

<snip>
>What you want is something I would like also, but I figure we're a long
>way from that kind of options...

You may be half way to what you want: I'm not sure how you'd stitch all of this stuff together to work in the right order. Starting the stuff off is probably OK: STinG can call Gary's launcher which can call POPwatch and NEWSwatch with appropriate options to collect the mail you want and then disconnect from the servers. Hanging up the phone line is a problem. Once you've hung up you can do the import and processing into Okami with a batch file (possibly also launch Okami, should you so wish?).

>Curley Colin;)

I was half owner in TEAM Software. And I wrote most of "A Day at
the Races". The company you mentioned above that did Lombard Rally was
situated in the Isle of Wight. We had some dealings with them early on
(many years ago). They were supposed to do a port of "A Day at the Races"
to the Amiga. But our dealings fell through and the port never happened.
They did, however, distribute "A Day at the Races" for the ST in the UK.
Could you be confusing that with an 8-bit version? There was never any
8-bit version released that I am aware of. A port was started to the
Commodore 64 in the States but canned after a few months.

Nope, use Gary Priest's Spawner program to launch POPwatch and NEWSwatch
(and Okami is you choose) after dialing is complete. Create scripts for
POPwatch and NEWSwatch to connect, download, disconnect, send, quit etc.
In my case, I actually have POPwatch check two different Mail servers with
no intervention from me.

To do this, however, you have to give up one of POPwatch's abilities, the
ability to retrieve headers and selectively delete unwanted messages. For
me, this was a small trade off.

I have the original 1.35b archive -- it's what I use on the TT. It's
really the author's decision, though, whether its distribution is OK.
Wasn't Jos particular about making the beta(s) available from sources
other than his own website?

Opinion seems to vary as to differences between Java and Javascript. The
site I am using to learn about Javascript has some very useful examples
of scripts so that is good (from a learning point of view), but I guess
the site authors have their own opinions about the similarities/otherwise
between Java and Javascript.

In the end the users end up confused, but as with any programming language
there are an (almost) infinite number of ways to get a job done. Perhaps
thats why some consider Javascript to be similar to Java in some ways.
Maybe those people have moved from Java first and are basing their use
of Javascript upon what they tried to achieve with Java first-of-all...

I haven't been able to borrow a fast modem but I've done 230k4 null-modem transfers to a Macintosh over serial port AND LAN port without errors. This only happens with MagiC running - with TOS/MiNT I top out at 57k6 (any faster gives errors)...of course I use HS-modem 7 to allow the higher speeds to work.

My Falcon has a PowerUp2 (32MHz 030)...but even with the accelerator off I can still use maximum 230k4 under MagiC...

The name of the program is Silkboot 3 by Mark Slagell. I have seen the program on different ftp sites, but can't remember a specific site. Check the Atari Archives at the University of Michigan. I know for a fact that it's available on Delphi in the Atari Advantage database.

If you can't find it send me e-mail at: villarreal@delphi.com, and I'll e-mail it to you.

Ditto.

About the only new thing I found was an option in the dialer config section to have the server allocate a DNS server address at login.

I was disappointed to find that I still can't get the dialer to load different dial scripts via clicking on the config menu's top line and picking a new one with the resulting file selector. It sometimes works but needs several attempts. I reported this to Peter R. a long time ago - anyone else have this problem?

>Setting up HSModem7 for the Falcon is a bit confusing. I'm still
>not sure that I have it set for Maximum performance, I can't
>go above 57600 for some reason and if using a larger resolution
The trade off is the video bandwidth, go for a lower colour range/screen size and you can go for a higher serial port speed. For instance when I had a Nemesis fitted I could do Zmodem at 112500 in 800*608, but there would be loads of errors at 800*608 in 256 colour. The CENTurbo I now have has removed that bottleneck.

>Before I started using STinG I was using HSmodem7 on my Falcon with

>rate one had to use HSmodem7 to patch the modem.cpx and use the lower
>baud settings to get something above 19200. This I'm fairly sure was
Basically the remapping facility was to allow you to use speeds over 19200 or 38400 with some older software that didn't have direct access to the higher speeds (such as TeddyTerm and the Cixcomm program that us Cixen use to access Cix conferencing).

>done on my Falcons HSmodem7 set up. Now when STinG came along it
>had its own Serial.Cpx that replaced the Atari modem.cpx and would
>allow higher baud rates than 19200.
The CPX's main use is to set the serial port for some programs that don't have any means of setting the port themselves (such as STinG).

>When I installed STinG, I used the same HSmodem7 programs with it
>that was setup for use with Oasis. Patched to allow higher baud rates
>above 19200. I wonder if this is somehow preventing my Falcon from
>using 57600 or 115200?
Best thing to do is to install a fresh copy of drvin.prg and scc.prg (watch the running order), there's no need to do any patching unless you want to up

the buffers.

>Don't Forget folks that STinG is FREE to the best of my knowledge.
>And has helped many Atari folks finally get their Ataris
>online. We all should be greatful to everyone who has helped

That's very interesting - and a little worrying too! I have to say that I
don't make much use of such as Aniplayer, but the few times that I've used
it and others like Apex I've had no trouble at all. It could be that any
memory corruption might be taking place in unused workspace I suppose.

> A lot seems to depend on the individual Falcon, as well as the Ram board,
> and Ram combinations...This is just my experience.. ;-(

There's little doubt that there are plenty of Falcons around that exhibit
all kinds of problems where others do not - I count myself fortunate to be
counted (mostly) in the latter group.

> Like I said though, why take a chance? Get the most recommended combination
> of Ram and board the first time... I went through, in this order:

Excellent advice, could save a bomb!

> Next? Well, I'm still looking for the Panasonic shielded 72 pin 16 meg SIMM.

I'm in the UK, can't really suggest anywhere. No chance of a bit of
home-made shielding?

> Count up the money I spent on Ram and Ram board upgrades to get where I am
> today. Not funny, huh? Titan told me not to do this, to go with their 1st
> and best recommendation but other Nemesis users kept telling me that each

I know what you're saying.

> Well, I hope you get a good solid setup soon. Once you do get Nemesis
> working right, you won't want to be without it. I love mine, despite all

I never had a problem with my Nemesis (apart from the flickery pixels), I
get the same effects with the CENTurbo that I now have (which is strange!).

Mario Becroft's PC keyboard adaptor will be available soon, I think that
you'd be best getting this and a PC keyboard which are cheap enough!

ITMT your floppy disk idea is workable.

1357. STinG (1.20) problems solved

Newsgroup: comp.sys.atari.st
Date: 1999-04-21 00:00:00 UTC
From: mt--------@telebyte.nl
Message-ID: <7fjsv7$90k$1@rubens.telebyte.nl>
Source record: 80335

At last, finally, my STinG 1.20 works the way it should, even with my single tasking setup. I now use the dialer as an APP and not as an ACC, the same works for XCONTROL.
I start XCONTROL.APP, return to the desktop, start DIALER.APP, connect to my ISP, return to desktop, then start CAB or NEWSie, and everything works as planned.
The many reactions on the thread in this newsgroup helped me a lot. Everyone thanx.
I'm just very anxious to read comments from the author(s) of STinG on our experiences.

Source record: 80341

What is the most widespread newsreader around. I'm pretty fed up with using Outlook Express at home. If only I could find an Atari mail/newsreader that would:

-Include both mail AND news
-Have ISO 8859-X character mapping (Newsie doesn't)
-Allow downloading all mail and subscribed newsgroups in ONE CLICK (even Netscape can't seem to do this).

I tried installing Okami a while back, but finally gave up and decided to wait until I got MiNT installed, as all the config files seem to be made for a MiNT filesystem. Would it allow downloading of everything in one click ?

What I want is to launch something then go and have breakfast while STinG would connect, download mail, download newsgroups and then disconnect. Can a STinG script do this with Newswatch and Popwatch ?

What about Amail, Mymail, Firenews, etc... ?

Hi Derryck,

I've been giving it try # somuch.

Created a new CPX dir, put the Sting Internal and serial ones in, managed
this time to set the Internal to active *and save it* without it going
corrupt, created a new STING dir with all the new stuff plus my old
default.cfg, dial.scr and dial.inf, replaced Sting.prg with the new one
and again the bloody same trouble: it connects OK, then it won't do
anything else. It just runs OK up till after the loginbatch, then checking
the ping it receives a few datagrams, then stops. I can try to run
Newswatch, Popwatch, whatever, it won't do it.

So then I moved back to my old CPX and STING dirs (which were renamed
temporarily of course), shoved back old Sting.prg into the auto and had to
issue *separate* at&r1 and at&k3 commands to my modem first before it ran
again. Even while the startup profile contains those commands, checking
the active profile displays them, I still have to feed it those two before
the setup runs again. That's ONLY after I've been trying the new Sting
version.... so what's wrong with that one?????
I have been running in the past with Sting 1.08, 1.10, 1.12 and 1.15
without any of these stupid problems. Now this one turns up in the new 1.20

I noticed the centr.stx has disappeared from the bunch.
Also, I seem to have no problems with changing dial scripts from within
the dialer, I once set it up thru' the dialer and have reconfigured it by
manually editing the scr. file and by doing it thru' the dialer... never a
problem.

What could be the problem with my HSModem setup when it always did a 100% job on Stalker, Starcall, Semper, Sting all versions up till and including 1.15, even Draconis ran once, I've been running very old comms prgs like Storm and Opus not so long ago and they never gave me one bit of trouble. Now Sting 1.20 sees the lite and the whole bunch goes bananas.... what's that??? U tell me, please!
Oops, I forgot: pppd runs bloody fine on the same setup too..., but you figure that's running Mint/Mintnet. It uses the HSModem stuff also, actually.

>STe Mega sitting around ...

Atari's TT030, MegaSTe and MegaST keyboards are completely interchangeable. Is there something wrong with your TT030 keyboard? Most TT-keyboard problems can be fixed with a new mylar circuit board -- its not a tough job to replace. If you need one, I still have plenty of them in stock.

Where did you find this? I've used Okami 1.34 for a long time myself
with Newswatch and Popwatch without any probs. There is only a little
problem to set up the right path for mail and news retrievement but that's
all. Once the paths are set right Popwatch and Newswatch runs just fine.

>This version was available for a long time on a home page of the author
>but it is no more.

Version 1.35 was an interim version between 1.34 and 2.

It really has lost everything. Fortunately I could send him the latest
beta release. After a month of so he was back were he was just before he
lost his data. Right now he is still working on Okami. When he'll release
a new verison I can't tell you though but when available you will be
surprised. It's really much better then the previous versions

No, I've only seen the 8-bit one. This was a mixture of some crude horsy
sprites and the usual table time input etc.

>>A day at the races was released in between 1984 and 1986!

Well, it answers it partially... The bl.... (sorry Ronald!) problem is
that my extra serials have been removed when the card was shoved in. So I
simply lost the connectors. The option appears to be to buy an adaptor
LAN/RS232, which is a Maclike item and thus is expensive... Next I can
test the LAN-port and see whether or not it works.

Hi Pat,

if I'm reading you right, it means I loose the killfilter option.

Dunno, I get a lot of junk e-mail, my killfile is already 2 pages large so I'm not so sure. Apart from that, IF I want it automated, it should be fully automated, i.e. leaving the dialler idling around, then it should connect all by itself, do it's job, running News- &Popwatch, and disconnect. Okami could be automated to import/crunch/export automatically, but doesn't have to do that straight after the stuff has come in. As long as that isn't possible, I don't mind hitting a few buttons here and there :-)

BTW: I just found out today that MS Word-97 automatically generates a smiley when you hit :-) on the kbd... wouldn't that be possible on an Atari, since the smiley is present in lotsa fonts (two different chars making up the smiley, like the Fujisymbol)?

Spawner can launch NEWSWatch and POPWatch singly if you add a '!' before
the program path. It's then just a case of picking the correct switches
to make them connect, send, retrieve, disconnect and quit. What you'll
probably end up with is something like this as you're 'spawner.dat' file

#Run POPWatch
![full-path]\POPWATCH.PRG /t /s /c /r /d /q

#Run NEWSWatch
![full-path]\NWATCH.PRG /t /p /r /q

In what way don't they work together? I used Okami from 1.32-ish with
POPwatch and NEWSwatch, and 1.34+ was very stable, no problems as far as I
could tell. I think this is the version currently on the Okami site.

There are a lot of very useful websites posted but the problem is that you don't necessarily need it just then and if you add it to the Hotmail in CAB in case you need it later you simply end up with a huge file on screen.

Does anybody know of an "address book" that these can be stored in automatically, on a "cut and paste" basis perhaps? At the moment I am doing this into a .txt editor but it would be nice if there was some sort of database you could use that could be accessed by CAB.

I see David Bolt already provided a "typical" script so I won't bother
you with more unless you have questions. The script's are unique to
NEWS/POPwatch and the syntax is clearly spelled out in the docs. The only
missing piece is you *do* have to hang up at the end of the session. I
usually check back in five or ten minutes and all is done.

As others have said, Jos has managed to recover and take Okami way beyond
its point of development before the crash.

Unfortunately, v2.0 has not been made publicly available.

My suggestion is to write to Jos, personally, and express interest in the
program. Let him know you want it and, hopefully, its development can be
resurrected.

It doesn't work though (I tried!). The login.bat thing doesn't seem to work
properly with GEM programs. IIRC, Peter R went into the ins and outs of it a
while back. This is why Gary wrote Spawner (the name of which I couldn't
remember in my last post).

>I'm wondering if the best way wouldn't actually be NOS. Does it support
>scripting ?

You may be right. It does support some form of scripting, but you might need
something extra to detect when to hang up and actually do it. It's a loooong
time since I used it myself and I never did unattended downloads. The fact
that there were various BBSs using NOS to collect/send stuff to/from the
internet implies that this might be the way to go.

I have found many musicians loving the power, and ease of use, of the ST.

I wonder if a niche market for a cheap ST clone, for midi software,
would be worthwile.

True. However 'facts' are only what novices like myself read from
websites created by people who believe they know better...in that
way its like psychiatry...psychiatrists imposing self-righteousness
upon those who know no-better, to 'declare' right or wrong...

Anyway, I'm happy with Javscript...it does enough for me for now...

> > SC1224 RGB monitor on a 25" Sony TV (perfect PAL broadcast resolution!
> >).
>
> What kind of frequency does this display at (vga one, I mean)?

The 800x592x256c display updates at a lowish 51 Hz. Some people
can't watch that, while others (like me) think its fine. I can
get a little more refresh rate out of it but the higher that goes
the lower my machine performs...

I'm only using a 14" VGA screen so more than 800x600 is getting a
little small to read...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

I also forgot this bit! ;^)

Please also remember that 800x592x256c on VGA at 51 Hz refresh is
achieved with -software only-. The hardware BlowUp and Screenblaster
should give much better refresh rates...

1405. Micq 4.0 port to STiK API released

Newsgroup: comp.sys.atari.st
Date: 1999-04-22 00:00:00 UTC
From: baldrick@dilbert.netset.com
Message-ID: <7fm5titfp1@athena.netset.com>
Source record: 80205

You wanted it, you got it. I believe I finally got the last of
the annoying bugs out of my port of Micq to the STiK API.

Micq is a very nice command line icq clone from the linux world.
Micq is not my work in the least. I mearly did the necessary changes to
get it working under TOS and the STiK API. For complete info on the
author and everyplace you need for micq help, read the documentation.

I believe all the functions are working now and it has been
tested under STiK and GlueSTiK. STiNG should also work as well.

Now all you need is someone to make a GEM client out of it.

Anyone interested feel free, the original code is under the GPL
and I make no claims to my changes. They should all be #ifdef'd as well
so porting future versions shouldn't be that hard. If you do decide to
put a GEM interface on this code and have any questions about my changes
feel free to email.

Well all this is in the doc files in the archive, so I'll let you
go. Have fun.

Dan Ackerman
aka baldrick@netset.com

What was that? I didn't give you the URL?

Well it's http://www.netset.com/~baldrick/products.html

1407. Hard drive Defragmentation Software

Newsgroup: comp.sys.atari.st
Date: 1999-04-22 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7fm72j$4t94@news.ajou.ac.kr>
Source record: 80207

Greetings Atari Folks,

I am looking for some Hard Drive utility software that
will defrag drive partitions over 400megs and up.

I have a older version of Diamond Edge v.1.10 and it
seems to not work with partitions over 300 megs or so.

Any suggestions is appreciated,
phantomm@kih.net

1408. STinG 1.20 - Where's the old TCP.STX

Newsgroup: comp.sys.atari.st
Date: 1999-04-22 00:00:00 UTC
From: leaver@dynamite.com.au
Message-ID: <7fmak3dde1@bomb.dynamite.com.au>
Source record: 80208

I had no trouble whatsovever getting STinG 1.20 working, either on my TT or MSTe. On the TT it is fast and a pleasure to use.

However, the MSTe still seems to be affected by the problem that I, along with others, suffered from with STinG 1.15 on both computers - that of speed.

The MSTe is good for about 350-400 bytes/second in circumstances where the TT woukd be running my modem to the limit. With v 1.15 the cure was to use the penultimate version od TCP.STX, but we ain't got such a beast with v 1.20

Could you please post more information on the way you reached that resolution. I personally own a SVGA monitor and I'd never managed to get so high. I'd like to reach such a resolution.

So please, could you tell me the software you used and the settings you specified.

Thanks in advance.

On mymail there will be news support but i have lot of work left to do on this
before it is finnished.
It will have support for ISO 8859-1 as mymail already have this.
At the moment it is only plans for online reading of news
and maybe later it will be offline added.

Yes I can leave XCONTROL as an ACC without problems. I just wanted to
remove all ACC's to keep available memory as large as possible, and to
avoid problems (even if they don't exist). But the DIALER as an ACC
does give serious problems.

>

Sorry! but I'm not confusing it at all. It was called 'A day at the
races' and I got it on tape for my 130XE!

A neighbour liked it that he got it for his 600XL.

I sent my dosh to Manchester, that's the place I think of when I think
of Red Rat.

Maybe their was 2 versions! At the time I'm talking about Red Rat did
quite a bit of Atari 8-bit work. Their claim to fame was to give 8-bit
users the software that was being produced for the other 8-bit machines.

I think Team came in the scene after this. I can remember that a press
release said that due to financial reasons they could no longer support
the 8-bit userbase and where thinking of producing software for the
other machines; or something along that nature.

A day at the races was released in between 1984 and 1986!

There is _one_ situation when it _is_ appropriate to reply via e-mail,
when responding to a "For Sale" post; others in the newsgroup do not
want to know about other people's offers, so you reply directly to the
author of the message if you're interrested in their goods.

Obviously, your intentions were not bad, so let's all move on.. ;-)

>
Don't know if this answers your question:
according to the owners manual: 'there are 2 serial ports. You can
connect serial devices to both ports, UNLESS you are using the local
area network (lan) port. If you are connected to a LAN, serial port 2
is disabled. The 8 pin DIN connector on the left and one RS232 port
(serial 2 ???) are controled bij a Zilog 5830 chip Two others are
2 MFP 68901 chips (modem 1 en 2???)
Why don't you connect the 14K4 to the serial2 port and give it a try.
Changing the serial.cpx first of course.

What do you mean by online news handling by Newsie??
I only get headers by puting an equal sign before bin group in
NNTP.DAT. The keymap.inf file says:
*M save-mid c:\okami\news\get
Pressing alt M during highlighting an article in the newslist makes a
file in c:\okami\news.
The next to you start Newswatch those arlicles will be completely
fetched.

No I don't think so. I've only looked at/worked with PC or MAC based cubase a little bit but as far as I can see they have never added any further facilities to the mixermap editor - they don't need to really as they got it right first time! For that matter Atari and PC/MAC cubase versions differ very little, except of course all the new VST stuff. So mixermap should be cross platform.

Hiya, I thought thats what you meant! Well yeah it should work, mostly. Trouble is lots of commercial games used funny formatting parameters to stuff more on a disk and/or copy protect the software, often they'd stick something unusual in the bootsector. If you have problems try getting hold of something like Magic Shadow Archiver. I don't know much else about this stuff so you're better off getting in touch with some emulator types.

I bought one a while ago from System Solutions. I think for about ï¿½30 inc. p&p. I think they use a german supplier. I will drag out the receipt. I never got it fitted. I think I bent one of the side contacts, the amount of pressure needed to seat in the socket is frightening. When I managed about 3/4 way down all I got was noise. At least I could get it out and didn't crack the socket. The only reason I got it was for Photoline. If I get another I will get SS or whoever to fit it, on a 'if it dont work, I dont want it' basis. I was going to bring my falcon to Stafford this month, but couldn't make it.

That's all very strange indeed. Have you ever seen the 16-bit version
of A Day at the Races? If so, was the 8-bit version similar? I seem
to recall a UK released horse racing simulation that was text based.
Was the program you had for the 8-bit text based?

>I think Team came in the scene after this. I can remember that a press

>A day at the races was released in between 1984 and 1986!

A Day at the Races for the ST was completed in 1988 or 89. We didn't
begin negotiations with the UK company until after the program was
released.

Am I late on this one?

In any case, as an old-time Atari user I took this as an interesting new sign. On the web site http://slashdot.org an article was posted saying that GEM was released under the GPL by Caldera (Linux Distribution Company). Here is the web site where more information can be found: http://www.devili.iki.fi/cpm/gemworld.html

Can somebody tell me more, and what these means if anything for the future of Atari computing?

As the others say, the whole point of usenet is sharing. No question is
"horse manure", even if it's a FAQ question.

The common practice is to read a newsgroup for a few days so as to be
able to judge by yourself the level of your question and whether it is
on-topic for the given group. In this case, even if it may have appeared
as a newbie question, that doesn't make it pointless. Somebody else may
have been asking the same question and was happy to share the answer.
That is how knowledge spreads on usenet.

No hard feelings.

I agree, just the fact that it's from MS makes me want to puke, but the
fact is, it's the only mail/newsreader that can connect, download and
disconnect in one go.

I don't care about marking the messages I want to download, because I
usually download them all, and it takes more time online to do that than
to simply download the whole thing. And phone bills in this part of the
world are EXPENSIVE!

Actually, I would like it to do this sequentially, so that it can hangup
the modem once it has finished.

I'm wondering if the best way wouldn't actually be NOS. Does it support
scripting ?

Yes, but spawner would launch News/popwatch simultaneously and then
these would wait for me to go and manually download everything. Then I
would have to disconnect and hangup STinG manually.

I don't care about that. I usually end up downloading everything, and
it's just a waste of my online time to go and mark messages to download.

I'm using BlowUp and using SVGA I can achieve 848x640 16 colours at
72Hz, 640x480 16 colours 80Hz, 640x480, 256 colours 60Hz (which is
flickery) or it can be achieved with interlacing. Can also do 928x658
monochrome 70 Hz, 1024x768 16 colours interlaced.

See my post above - I'm using BlowUp030 Hard 1 - it comes with some
pre-installed settings, but to get your own cusotmised settings you
just have to play around with Vsync, HSync, resolution, refresh etc.
parameters to find one that is stable on both your Falcon and your
monitor.

See also:

http://www.seasip.demon.co.uk/Gem/index.html

I have used Superbase 4 for GEM on my works PC. The version of GEM was better than ST but much cruder than Falcon. The manuals however are superb, one each for the database and for the editor, both on glossy paper ring-bound 1" thick plus and in a very sustantial case. Was the Atari manual for the Pro. version up to this standard, I only have the typical, 'down to a price', 'Personal' paperback one.

I can't be sure as I don't have partitions that big, but why not try HPOPT27? It's a modern de-fragger which ought to be able to cope. I use it routinely and it is very stable and effective.

The README file I have here is in German, I'm afraid, but if you pick up the program from Derryck Croker's 'Cheshunt' web site you will find it has an english translation.

Like Chris Wilkinson, I run my Falcon on an RGB monitor (I haven't a VGA) and use Videl Inside, to get up to 800x592 interlaced at 50Hz. The flicker is just acceptable to me. My working res. is 640x480x256 at 61.1Hz for graphics work and 640x480x16 at 61.1Hz for the Internet. The flicker at 61.1Hz (30.55Hz frames/sec) is only noticable on the window frames. There is of course the usual trade-off between speed (screen update) and number of colours. I would be suprised is Chris gets a fast update at his SVGA TC resolution.

If you want my VI.INF & VI.DAT files then yell

Well, here is an article I read on slashdot. The URL is here:
http://slashdot.org/articles/99/04/22/1117247.shtml

Here is the article:

Posted by Hemos on Thursday April 22, @09:17AM EDT
from the let's-do-the-time-warp-again dept.

acb writes "Remember GEM, Digital Research's
Mac-clone GUI, seen on old PCs and Ataris?
Well, Caldera have now released the source
code under the GPL. Should be interesting,
from a retrocomputing point of view. "Someone
fire up my ST. Oh wait-I don't have one."

Check out this site for the downloads:
http://www.devili.iki.fi/cpm/gemworld.html

> >
> Sorry Jo but Olga works very fine with MiNT/N.AES. MagiC isn't needed at
> all.

The point probably is that the latest (?) Aniplayer 2.05 does not
work under MiNT. It bombs out at initialization time. Funny enough,
it is apparently caused by some MiNT related code inside, that has
a bug. Fix follows:

- load ANIPLAY.PRG to a binary editor (LOOK.APP is great)
- search for string "MiNT" (its the cookie tag to be searched)
- change it to anything else, e.g. xxxx or someshit.
- save the modified binary

Since that, when the ANIPLAY does not know anymore that it is running
under MiNT (it just thinks it is plain TOS), it works...

No comments.

You need to install: OKAMI, NEWSWATCH, POPWATCH and SPAWNER.

>I tried installing Okami a while back, but finally gave up and decided
>to wait until I got MiNT installed, as all the config files seem to be
>made for a MiNT filesystem. Would it allow downloading of everything in
>one click ?

I am using OKAMI with a plain TOS 2.06.
If you can't manage to configure OKAMI, than ask!
Some time ago I sent to c.s.a.s. a short instruction how to install
OKAMI to work with NEWS/POPWATCH - do you have it?

>What I want is to launch something then go and have breakfast while
>STinG would connect, download mail, download newsgroups and then
>disconnect. Can a STinG script do this with Newswatch and Popwatch ?

SPAWNER can do it. Get it from Gary Priest home page.
All versions work with MagiC also, but for a single TOS the best is an
old version 1.01 (I can send it to you if this version is no more
available).

Well, I got the old 1040ST set up and running, and to save some
ware and tare on the TT keyboard, I'll do all my typing here. The
only time I can't do it this way is if I'm on the web, then I'll
have to do it with the TT keyboard.

I've seen some post saying the STe mega keyboard is the same, but I've
not seen one myself, so can't say, now if someone has an old broken
STe Mega sitting around ...

In the meantime, I'm still looking for a 6 chip set of TOS 1.4 that
someone could let go cheap.

Does anyone have a hard drive host? it could be Atari, Supra, ICD, whoever, and if it
works, maye a deal can be made.

Source record: 80095
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,or.forsale,pnw.forsale,rec.games.video.atari,rec.games.video.marketplace

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with NewsGroups.

I've been working hard on adding more Atari stock to my inventory. I
wanted to have everything in place by April 15th for those of you with
Tax refund checks. Still, I've done pretty well. I'm having a "Come
spend your Tax Refund in my store event!" I have NEW Atari ST SoftWare
for sale! These $15 titles are marked down to $10. So even though the
*NEW......$15 ST Software says $15, it's really $10. Each one is "*NEW"
and most are ShrinkWrapped! You'll find these titles in my ST SoftWare
Catalog. Feel free to take my Catalogs and see what new HardWare,
SoftWare, Books & Accessories I have for the Classic Atari 8 Bit and
Atari ST.

<h3>Click for WebSite!</h3>

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-
Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at
http://www.atari.benjamin.net And Jump to my FTP site linked to my Web
Site so you can Download Free Catalogs or FTP directly to my site at:
ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way,
Feel free to Request catalogs through E-Mail. Really, it's not an
inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both!
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail.
Please let me know if I can attach text files to your E-Mail. Catalogs
are just regular ASCII text files so you can download them into your
text editor and view them, edit them or print them out! It would make
things easier for me if you take my Catalogs, load them into your text
editor, delete what you don't want and E-Mail me the rest! To expedite
things, include your complete Mailing address so I can figure your
Shipping/Postage & Handling. I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or
bensmith@teleport.com. If you can't reach me at benjamin.net see my
E-Mail/Web info in my Signature at the Bottom!

1454. FS: Box of ATARI equip (HW/SW/Books), incl. Off. Dev. Kit $75

Newsgroup: comp.sys.atari.st
Date: 1999-04-23 00:00:00 UTC
From: Nima Montaser <nima@nortelnetworks.com>
Message-ID: <37207C6D.63B1@nortelnetworks.com>
Source record: 80099

Hi,
Since I will be moving soon, I need to offload the following
items, all in a box. Shipping is extra.
The items are all as is with no warranty.

1- Atari Developers Guide, covering upto TT030. (ST/E/TT)
Three binders and the original ATARI dev. kit diskettes
2- Several Abacus series of books: Gem programming, ST Disk drivers,
Peek & Pokes, ...
3- Borland TurboC v2 (predecessor to PureC), German docs,
English menus. Many other programming related items such
Database related stuff all for ATARI.
4- ICD ADSCSI Hostadaptor
5- 1040 ST (hasn't been used in a long time, no guarantees)
6- Mupptes 4MB RAM expansion kit for ST (no manual or disktte)
7- Lots of programs in their orig. packing and some diskettes
only, including Geneva, HyperLink, ... (too many to list off)

And other goodies that I can't remember.
Again, many items on the list I haven't touched for ages now.
So I don't warrant any thing, but last time I used them,
they all were OK.

If you are interested, please let me know by email.
The price is $75 US$, or $115 CDN$. Shipping is extra (It
is going to be a hell of heavy package :(

Hi folks,

I downloaded the following file from SRC.DOC.IC.AC.UK last night.

/infos/hypertext/st-guide/compend.lzh ;The ATARI Compendium ST-Guide HYPertext v1.02 (FREEWARE)

great, I thought, all those docs as a hypertext :)))))

Unfortunately this seems to be part of a CD collection and the included INSTALL.PRG refuses to run - I managed to fool it into thinking a partition was a CD drive but it still claims 'not original CD'.

Can anyone offer any help/suggestions?

On my setup I got this error message because serial.stx was not in the
/sting/ folder.

Make sure all the .stx's are in a /sting/ folder on your route drive
(c)

Also don't forget to activate sting from the cpx.

Yup, main suspect is Freedom, but I said before I won't let it go easy.
Sting 1.15 still works bloody fine here.

Spent some time on getting Spawner to work, configure the dat file and it
now saves me a lot of keystrokes/mouseclicks!

Next one is automating Okami and next step would be some batchfile for
Sting to start at a preset time, do it's job and after the last action
terminate the connection again.

Well, since we're talking about automated operation, I would like to know
how I can stop the import/export/expire ttp's of Okami to wait for a
keypress.
I know it's the -h option for all of the three, but WHERE do I set/change
that???

The less bloody keys I have to strike the luckier my kbd is (and me too).

Now Jos added automatic boxes when mail gets in "shall I import?" which
needs to be confirmed, then another one pops up "shall I expire first?"
waiting for yet another confirmation.
This kinda automation only drives me mad :-)

But it is easy to write a little client that send a UDP message to
STinG and it will hang up. I have one for Win-95 on my home page.

I would like to see a "connection pool" utility that works like this:

Client 1 asks the pool "I would like to be online".

The pool sends the logon UDP message to STinG. When connected STinG
returns a result code (unfortunately not the correct one at the moment
due to a bug in STinG) to the pool and the pool informs the client of
the online status. Now client 1 can use the connection freely.

Client 2 also ask the pool to be online, gets online status back, and
starts to use the connection too.

Client 1 no longer needs to be online, and informs the pool about this.
But as Client 2 still is using the connection nothing happens.

Client 2 also informs the pool it no longer has to be online. As no
client wants to be online the pool sends a hang up UDP message to STinG.

1465. Stik help

Newsgroup: comp.sys.atari.st
Date: 1999-04-23 00:00:00 UTC
From: Chris Swinson <chris-swinson@mega-disczine.freeserve.co.uk>
Message-ID: <7fqdsj$5qe$1@news8.svr.pol.co.uk>
Source record: 80110

I cannot for the life of me get Stik on my Falcon to work ???

Is it Falcon compatible ?

I know my modem is ok for AT commands casue it work in the old ST emulator program. Or any other good dialup programs for my Falcon should you know of any ?

Thanks

chris.swinson@zetnet.co.uk

1468. Atari ST games to a real ST

Newsgroup: comp.sys.atari.st
Date: 1999-04-23 00:00:00 UTC
From: sheercon <sheercon@earthlink.net>
Message-ID: <37205C8A.F3477A41@earthlink.net>
Source record: 80113

I've been trying without much luck to transfer Atari ST files I got over the internet (in the .ST format) to a real Atari ST. I've played these games on an Atari ST emulator but I think they would be better on a real Atari 1040 ST. Could anyone give me some tips on how to do this? Do I need some "conversion" software? I tried formating a 1.44mb disk with TOS on my ST and it says the disk is not formatable, do I need a 720k disk to do this?

Any help on this subject would be greatly appreciated... and I'd like to thank those who helped me with my previous question.

Brian

>fetched.
>
Hi Bram,

well I tried it that way with Newswatch: I don't like it. First of, the
speed Newswatch retrieves is awfully slow compared to all other stuff;
then the way I use Newsie for that is a lot faster.
Imagine you connect to a group having 100-500 new items a day...
When I connect Newsie online, it takes the "Xover.txt" file at max speed,
then you quit and load it into a txt editor. Select the numbers, start
again later and fetch the articles by their number. In case you have more
than one of those NG's, after each one comes in, go to the desktop, rename
the one to xover.whatever, next go to the next NG and get another
xover.txt and do just the same. Compared to the way Newswatch handles
this, it is WAY faster. Well, of course stricly my opinion, but again, I
pay my connections by the second and therefore time counts. I still
believe Newsie's unsurpassed on online news handling. At the same time,
while checking the xover.txt while online you can select the items you
want and they get in, without loss of time.

I love Okami, even the latest version with all the bloody alertboxes
popping up but I love Newsie for online newshandling better.

Reading back my own msg, I believe my cat (DO I have one?) has fallen
asleep... (nope!)

1473. Atari PLIP <-> PC (Linux)

Newsgroup: comp.sys.atari.st
Date: 1999-04-23 00:00:00 UTC
From: Chris Martin <cmartin@ti.com>
Message-ID: <3720E154.5C180300@ti.com>
Source record: 80118

Okay, I know I have heard this discussed here before, but
does anyone know how the Atari PLIP differs from the Linux PLIP?

I know that the Atari has some signals missing from the parallel
port that the linux PLIP is expecting to use, but has anyone hacked
the PLIP code to get it to work...or is this even necessary? I want
to be able to connect my ATARI 520st or TT030 running STiNG to a
PC running Linux via the parallel port using PLIP.

Thanks for the help,
Chris

1474. Done it!

I don't know how a Matrix card looks like (you have one isn't it?) but on
my TT030 I've a Crazy Dots II and I also have the serial 1 and 2 ports
available. Just insert the modem cables on the connectors on the motherboard
and pass the cables beneath the card throughout the outside.
I know it isn't a beatiful sight but it works.

Really? So what exactly did you do, what version of MagiC Mac was it, and
what was his system specs? (RAM..Virtual memory On or Off?)
Also, what were the error messages you ran in to? Were you Forced to Quit
MagiC, Forced to Reboot, or were allowed to choose between closing the
program or MagiC all together?

technically it should be possible - I've read that there are USB
cards which fit into PCI slots, so therefore it should be just a matter
of writing the proper drivers to make use of the card. Of course, you
also have to take into consideration that you'll have to write
individual drivers for just about any USB device out there that can be
made of use on a TOS-based system. Still, it should make for a very
interesting projects....

I'm surprised nobody has brought this up.

It's my understanding that the previous author asked Jos to stop accepting money for Okami, because it was always intended to be freeware. Since several people had already registered (myself included), Jos was nice enough to continue work on 2.0 for those already registered, but AFAIK, there will be no public release. I also don't think there will be further development of the freeware version by Jos.

If I'm wrong about any of this, I apologize. But this is my interpretation of Jos' comments to the beta group some time ago. It's also possible that there has been a change of plans. I've resisted commenting previously, because I thought Jos would clear things up, but he hasn't posted here in awhile (which would also seem to support the above interpretation).

Well don't know where to find it anymore. You could do a search around the net. You might ask Howard Chu, but by a brief guess he preformed the task over a decade ago. I really don't know what to tell you beyond that. Maybe some modern day person want's to take a shot at it. I know it is possible.

You know the really sad thing to think of, I bet you the last discussion I saw/took part in on this topic was before deja news started :/

Hmm, this sounds strange to me.
Everyone I have talked to say that MagiC Mac is /rock/ solid. I would have
to agree with them, and this is on a G3 233

Have you had different experiences?

Hello,
Well then, new to MagiC Online is the Interview Section, where there are exclusive MagiC Online interviews with popular Atari/MagiC Programmers :-)

Currently there are two online, but more are being worked on. The ones you can currently read are:.

Manfred Lipper, Author of jinnee

and

Thomas Much, Author of texel, NBP

So feel free to read what they have to say, there plans for the future, and what they think about the future of the atari platform.

Best place to look for data on the 030 is on the Motorola web pages. Most documentation is in PDF format, so you will have to install GhostScrip on the Atari or have access to Adobe Acrobat on another platform. Probably the lest expensive source for Atari specific information would be to purchase the Atari Compendium CD Rom. It would save many hours of internet time. I think that Systems for Tomorrow still stock them. Mike

The way it's supposed to work is that your default.cfg contains connection info for your primary ISP, with dial scripts detailing changes for alternatives (watch those ISPs which don't have http proxies, otherwise CAB may pick the wrong one). That's how I understand how it's supposed to work.

Then all you have to do is pick the ISP you want to use from the configs section.

>But I don't have any other programs hooked into STinG, Just a

You can order dokumentation on the 68030/FPU/PMMU from Motorola free of charge. Just go to http://www.mot-sps.com/home/lit_ord.html
I strongly recommend the M68000 Family Programmer's Reference Manual (M68000PM/AD), it covers 68000 through 68040. I also recommend the 68030 User's Manual. They're for free any way. ;-)
You have a big list of Motorola's manuals here:
http://www.mot-sps.com/lit/index/Reference_Manuals.html

I think that the Atari Compendium is the best choice when it comes to GEMDOS,BIOS,XBIOS and hardware registers.

>
> Any ideas?

I installed STing 1.20 on my CT2revA some days ago, and it works just fine. I replaced everything: Dialer, cpx's, sting.prg. I also made sure that I didn't use any of the old STX-files from the previous package. The dialer used to crasch all the timer when I used v1.15 of sting, forcing me to surf the net on my other unaccelerated falcon, but with 1.20 it works. I use hsmodem 0.7, and both drvin.prg and scc.prg (version patched by centek) runs before sting.prg in the auto folder. I also use Magic 6.0, but haven't tested sting 1.20 in normal TOS4.04.

When do you get this bus error, when running sting from the auto-folder?

Admittedly I've only tried the demo's, and yes they're really unstable. Not very effective as demo's -
I'm hardly likely to spend a rather large sum of dosh on a program, when the demo falls over almost immediately. And MagicMac is more expensive than a real ST, and much more expensive than full feature emulation packages like 'VirtualPC' a full Pentium emulation for Macintosh.

I've heard MagicMac runs much better on old 68K Mac's, Quadras and suchlike....

Yes, it works. But the previous versions of Okami didn't create an
empty file SEQUENCE.SEQ (needed to send news) inside directory
/O/MQUEUE/. It was needed to create this file manualy.
I am not shure when this was fixed - in ver. 1.35 or 2.0.
Most of new features for NOS mode were added in version 1.35.

Martin, I meant I lost the connectors. They're no longer there. I bought
this machine from someone else who added the card and removed the 2 serial
connectors from the board and (maybe) threw them away...

I've been asking recently about how to fit two (or one) new serials on the
3 sets of pins sitting on the PCB below the card, but no-one appearently
knows the pin lay-out.

Joergen, take a look at the latest Phenix specs... comes with USB fitted
standard. Also IDE, SCSI will be standard. OK, the price is something more
than a Milan, but my bets for the moment are on this Phenix. Motherboard
is ready to take two 060's as well. They switched to DIMM's too, good
choice.

>Poor Louis. :)
>
>Have you read this in o.inf?

--snip--

Hi Jos,

ooooooooooppss! Well, I took the inf file from my old set. I've added the last lines from the new one now, setting it to 1.

Now we're at it: how can I set the import/export/expire ttp's options? I want them "not to wait for keypresses"... Can't find it in the docs, just that they can be set with option -h for that and appearently they are, but I want to change that. Somehow Okami instructs them to work with -h, but I can't find where the instruction sits...

I've said this before, but IMO the new one imports/expires a lot faster than the old one... has this to do with the conversion of the indexfiles?

If I need an extended formatted disk to be read via a pc, I use DC
Format 3 on the ST; this allows extended formatting and you can also
slap a MS-DOS boot on it;)

There are other programs, I think Fastcopy Pro can add a MS-DOS header!

> comming out with the USB interface,

Underline _cheap_, as in "really ain't worth shit".

USB is the most bloated hardware spec ever produced. In fact, they've
it's soalready moved to USB-2, which says a lot about how badly designed
it was in the first place. Pathetic...

> it's almost essential if they (the Milan team) want to sell the
> machine.

Quite far from essential. There's already _plenty_ of ISA and PCI
cards, some of it completely brilliant, that hasn't even been tried
on the Mac/PC platform, simply because those marvels are produced by
marginal, lesser-known manufacturers.

Hi,

re the probs I've been experiencing with the new Sting stuff, today I found out something new.

A few months ago I plugged my 14K4 modem hot into the Modem-2 port, after that I had crashes from Sting and also from Starcall. I switched back to Modem-1 and it all was fine.

Today I bought a 56K/V90 modem, hooked it into Modem-1 and tried it, and all was fine. Lately I've had some probs with Sting sometimes freezing after the connection was ended.
The first test of the new modem on Modem-1 went fine, then I hooked it onto Modem-2, set on 38400. This went perfect too... so probably not my modemport has blown but something in the old modem screwed up.

Now I'm first gonna look for this LAN/RS232 adapter, then I'm gonna try LAN for max speed and test Sting 1.20 again.

Gotta find a PC shop with this adapter available first :-)

Excellent news -
>Anyway, in the end, it all worked. The Falcon passed all the Nemesis testing,
>and runs quite happily in LO and HI. In fact, with the help of Videlity, I'm
>in 800x608x256 as I type this up in QED, and it looks very nice! No screen
>garbage or troubles at all. Who says 70ns RAM isn't fast enough? :^P

>*Some bad news:

>-I did have the hard drive do it's little "pause" thing once so far. And I
> thought that was supposed to be a thing of the past with the Nemesis buffer
> board installed!? :^(

The SCSI fix on Nemesis gets rid of SCSI read/write errors when running
some of the higher resolutions and higher clock speeds. Occasionally some
drives may pause during transfers but we couldn't figure out what caused
it. The main symptoms of SCSI problems are programs crashing for no
apparent reason and corrupted data on the drive.

>-I can get a nice 640x480 true-color display when I use the AUTO folder
> program HRTC.PRG, and everything looks fantastic and works well. But, if I
> try to use Videlity to get into true-color mode, I just get a blank white

Couple of suggestions here. Firstly make sure that you're modifying the
correct modecode. Double line OFF, 40 columns, TRUE in the modecode box of
Videlity. The 80 column mode is only available on RGB monitors.

Do not enable HRTC as well as Videlity - HRTC is simply a single mode
version of Videlity & will interfere quite badly.

Make sure Videlity runs *after* NVDI in the auto folder.

You should find a line in your MAGX.INF file like this :-

#_DEV 5 26

if the last number is unusually large then you've probably used Blowup
before & the line needs to be changed to a valid modecode.

The line above is 640x480x16

This one is 320x480x65536

#_DEV 5 20

Assuming that's ok the best way to proceed is to delete VIDELITY.INF from your auto folder so you get no modified modes. Reboot the machine & run VID_CONF. Select Double Line OFF, 40 Columns, TRUE in the mode code box. This should now display 320x480 and all you need to do is change the pixel size button to 1/4 to get 640x480. Save the modified mode (the disc icon at the bottom right)

Under Magic change res to 32768 colours, 320x480 & you should get a 640x480 screen.

> the deal? The Nemesis manual even says:
> "Using Videlity with Nemesis it is possible to realise true-color
> resolutions of 720x528 on a standard VGA monitor, although a multisync
> could take this further to 768x576!"

ahem - that really does depend on the monitor. Basically, if you can display 640x480x256 you'll get 640x480x65536 though most people should be able to display a fair bit more. 720x528 displayed OK on an old AOC fixed frequency monitor so most should be able to display that.

Follow the instructions in the Hypertext using the frequency lock button to get TC modes better than 640x480 or try some of the modes in the library provided - extra modes may be found on my web site at :-

Hi!

A new version of Mountain, my video editing software is
avaiable pn my web-site.
Here are the news this version :

Version 0.87 (19/2/99)
----------------------
+ new effect "Vertical Wobbler"
+ Bug corrected in "Vertical mirror"
+ New TimeSpline mode : "B�zier", faster and more intuitive.
+ Interpolation active in "Manual" mode.
+ New screen LDG use, all display mode from 256 colors to 32 bits are suported.

Version 0.88 (22/4/99)
----------------------
+ new effect "RVB control"
+ Precalculated animated preview active (for registered users)

Version 0.89 (24/4/99)
----------------------
+ Bug fixes
+ Most windows are closed before starting an external viewer.
+ Improved redraw when resising windows with Winix or Magic.

Enjoy !!

Well, I just did a session on Sting 1.20 and it went splendid.
There must have been some hardware problem with my old modem lately, which
turned up with the use of the new Sting. The old one worked OK, but
sometimes had "freezing" tendencies, which started to show up after the
initial installation of Sting 1.20.

The new modem now is hooked into Modem-2, I ordered an adapter LAN-RS232
and then I'm gonna use it at max speed from the LAN-port.

Sofar I had regular connections at 3500 cps with Newsie, aFTP fetching a
600k file at 2975 (including the 3-4 interrupts in the connection to my
ISP) and the rest looked OK as well.

Fetched the latest Aniplayer as well and it does a fair job on MPEG's now.

So I hope the problems are over again, apart from this Virusmultiplier
showing up every now and ttthhheeennn...........???

I'm scratching my head over this screen resolution expander from Centek. It works very well under single TOS, but I cannot see how to use it with MagiC/Thing. About the best solution that I've found so far is to call Videomod to select the screen res that I want, and then go to Thing's "Change res" menu and click on any of the resolutions there to actually force the new resolution.

Surely there must be a better way? Please?

HI

You need a utility called STTODSK available on most atari FTP sites
under utilities or emulators. Some people consider this piracy as most
(or all) the st games are "hacked". Also some people consider this a
way to preserve the atari platform, so take your pick. A BIG topic on
this newsgrp sometimes!

Basically you drag the .st file to the TTP and it writes it to a 720K
disc. Be careful though...some of the entrance screens after rebooting
contain pornography! So don't let your wife catch ya!

VP ran on the 8086 as well which IIRC has the opposite endianness
to 68K, so I doubt that would be a problem.

I'd be very surprised if VP wasn't written in C or C++, so it would
probably be not-too-difficult to compile with gcc.

That may be a solution for one program, but assumes that there aren't
other portability concerns. C isn't inherently portable; programs can
be written in such a way as to be ludicrously unportable. (Esp.
MS-DOS, Win16...)

And the solution only gets at one aspect of point c), doing nothing to
resolve the issue of availability of source code.

Hi folks,

Louis, I'm glad to see you are getting the problems with the
new STinG worked out. :)

After reading the last few postings in this thread, I got interested
in this LAN/RS232 adapter. Is there a adapter for the TT/Falcon that
plugs into the LAN port and allows a normal connection to a standard
modem?

If so, great I'd like to get one and try on my Falcon with STinG.
What is the highest baud rate one can obtain on a stock Falcon
using the LAN port with STinG?

There is a program called ColdBoot that comes with ICD's software that
does this mate.

>autofolder program, and/or an URL where I can download it ?

I don't know if its commercial or Shareware, or even if there is a
shareware equvalent mate.

Very Well Done.

System Solutions should have supplied you with HD Driver and this will
be the best solution. The lead you require is SCSI 1 to SCSI 2. I am
assuming your Zip is SCSI 1 (mine is with the supplied converter).

Phantomm,

It really surprised me. I was pretty much convinced my Modem-2 port had blown, and today I discovered the new modem worked 100% on it.
So I destilled from that I had a problem with the old one, next gave Sting 1.20 another try and it worked straight away...

>

Well, from what I gathered the LAN port is the same as Serial-2 on a TT. Since I lost the connectors for Serials 1 and 2 I can only use the LAN to hook a modem to. It doesn't support one signal, but that's not very important. I understand it supports up to the standard 115K transfers.
The problem with Modem-2 (and Serial-1???) is that the speed settings are Atari-only (that is: higher than 38400).

I've seen a posting not so long ago that the LAN-RS232 adapter is a DB-422 (?) type, my electronics dealer could order a Maccable LAN to RS232 (25 pins) for me, which should do the job.

If you have the money to buy ASH Emailer, then you get all this. The only problem is that it doesn't work with STing. And to my opinion is the newsgroup downloading rather slow compared to other newsreaders. Oh, and you can't read news online.

I completely agree here.
the Win32 environment also supports "nesting" the Win32 file selecter within another, so that in case something more was needed, you have the general layout, and you can add other controls that do something special

I don't think that the term "standard" is well-placed here; a better word to use might be the word "convention."

And this takes me back to the old days of the Atari ST. It provided two things that were very nice:

a) A "common" file selector that could be used by all applications, and

b) A "hook" whereby the user could slip in a link to an alternative file selector.

By providing a reasonably acceptable common file selector that could be used anywhere that you wanted to select files, Atari implicitly discouraged the proliferation of vast numbers of alternative file selectors that were "attuned" to a particular portion of a particular application. [Compare to the consideration that every GUI application framework for Win32 and X seems to provide Yet Another File Selector...]

And by providing that "hook," there was the ability to link in a substantially better file selector. In the latter days, I used UIS III (Universal Item Selector III), which was a generally powerful file utility that masqueraded as a file selector. Others used Selectric, Geneva, and others...

The goal would not, here, be to try to be overly "fascist" in *forcing* applications to use "The Mandated File Selector," but to try to be persuasive by providing a facility that is *useful,* improving functionality/convenience for users.

[And in much the same way, establishing a library that provides useful semantics for reading/writing configuration files would similarly be useful. If its usefulness proved persuasive, that might cause it to be widely used. If not, then not...]

Recently on one of Martin's Belgian Site update posts, I noticed a mention of an English Version of the File Selector BoxKite being posted. I downloaded it, tried it out and it's pretty cool; a nice modern version of Selectric but still supported. I liked it enough that I already registered it and have no regrets.

If you're looking for a compact File Selector with modern features like long filename support which is still supported you might give it a try.

From: Jeff Brubaker <jtb@email.unc.edu>
Message-ID: <372277BB.D3B0198C@email.unc.edu>
Source record: 80085

I just tried setting up a PLIP connection to my Falcon the other day (from my Linux box) thinking that would be the best way to give it a nice network link - maybe even faster than PPP over a null modem cable (how I've got it right now).

Unfortunately, it doesn't seem to work. When I ping from the Linux end, I get no response. When I ping from the Falcon end it bombs out every time.

This is sting 1.15 (haven't tried 1.20 yet). The reason I even ask before trying 1.20 is that I figure someone out there has to have tried this before. Could the Falcon have a different type of parallel port that causes it to bomb out? I've ruled out the OS, since I've run it under MagiC and GEM.

The main goal with this is actually to see an increase in cps - I don't get nearly the throughput I was expecting with a 115kbps serial link, so I figured I'd try the parallel port. Anyone know what rates to expect and how fast the Falcon's port is?

Thanks,

Jeff Brubaker

This problem is easily solved by hand - just make an empty SEQUENCE.SEQ file
in your queue directory (using something like Everest). People who switched
from Oasis already had one so didn't even notice the problem. It's annoying
if you don't know though: perhaps a change to the docs would do the trick
until the new version is ready.

I don't think that the term "standard" is well-placed here; a better
word to use might be the word "convention."

And this takes me back to the old days of the Atari ST. It provided
two things that were very nice:

a) A "common" file selector that could be used by all applications, and

b) A "hook" whereby the user could slip in a link to an alternative
file selector.

By providing a reasonably acceptable common file selector that could
be used anywhere that you wanted to select files, Atari implicitly
discouraged the proliferation of vast numbers of alternative file
selectors that were "attuned" to a particular portion of a particular
application. [Compare to the consideration that every GUI application

framework for Win32 and X seems to provide Yet Another File
Selector...]

And by providing that "hook," there was the ability to link in a
substantially better file selector. In the latter days, I used UIS
III (Universal Item Selector III), which was a generally powerful file
utility that masqueraded as a file selector. Others used Selectric,
Geneva, and others...

The goal would not, here, be to try to be overly "fascist" in
forcing applications to use "The Mandated File Selector," but to try
to be persuasive by providing a facility that is *useful,* improving
functionality/convenience for users.

[And in much the same way, establishing a library that provides useful
semantics for reading/writing configuration files would similarly be
useful. If its usefulness proved persuasive, that might cause it to
be widely used. If not, then not...]

You don't need a special driver, the one you already have will work.
However, HD-Driver is highly recommended, especially for removable media
since it has full support for it. It also has the
"TOS+DOS"-compatibility-mode which makes your Zips readble on both PCs and
stock Ataris.

1554. My NEMESIS is Alive and Well!

Newsgroup: comp.sys.atari.st
Date: 1999-04-24 00:00:00 UTC
From: Nurmix@socal.com
Message-ID: <7fr4jf$2kk3@enews3.newsguy.com>
Source record: 80134

I just thought I'd let everyone know that my Falcon is now humming along quite nicely with it's newly installed Nemesis board!

I made the trip to ATY Computer (in Oakland, CA) on Wednesday from Los Angeles, and it only took me 5 hours to get there. Anyway, Alex did a very thorough and professional installation job, as expected. I was in his shop the entire time, and watched as he effortlessly went about installing everything by the book, testing it as per the Nemesis manual all the way.

I was a bit worried when we first took a look at the RAM SIMM I had in there. It was a 70ns model (72-pin / 16meg), but Alex assured me that it was of very high quality, and that there shouldn't be any problems. And it turns out the RAM board I have is also a good one. I don't recall the name but Alex told me it was a German model, and that it was also well suited for the Nemesis. I guess I never knew for sure which board was in there since I had an Atari shop in Los Angeles (Alternative Computing - now strictly MAC/PC) put the RAM board and SIMM in there back in 1995 when they were doing the Cubase Audio mods.

Anyway, in the end, it all worked. The Falcon passed all the Nemesis testing, and runs quite happily in LO and HI. In fact, with the help of Videlity, I'm in 800x608x256 as I type this up in QED, and it looks very nice! No screen garbage or troubles at all. Who says 70ns RAM isn't fast enough? :^P

Ultimately, I am very pleased with the Nemesis. CAB 2.7 looks great in this resolution, and I have so much more desk space I don't know what to do with it! I'm also very impressed by how quickly JPEGs are displayed when in true-color mode, wow! But...

*Some good news:

-I'm using ICD Pro 6.5.5 and it too is working just fine. I did purchase HD Driver from Systems For Tomorrow though, but haven't installed it yet.

-The serial port does work now at 115,200 (HSMODEM 7/STinG 1.15)

*Some bad news:

-I did have the hard drive do it's little "pause" thing once so far. And I thought that was supposed to be a thing of the past with the Nemesis buffer board installed!? :^(

-I can get a nice 640x480 true-color display when I use the AUTO folder program HRTC.PRG, and everything looks fantastic and works well. But, if I try to use Videlity to get into true-color mode, I just get a blank white screen. And I've tried numerous true-color settings in Videlity (including of course 640x480). And unfortunately, the guy I bought the Nemesis/Videlity from in Finland forgot to send the Videlity manual, so I don't think I have

all the information I need (yes I've read the Videlity HYP file). So, what's the deal? The Nemesis manual even says:

"Using Videlity with Nemesis it is possible to realise true-color resolutions of 720x528 on a standard VGA monitor, although a multisync could take this further to 768x576!"

Not here it can't. Even 640x480 is no go in true-color with Videlity. And running HRTC.PRG along with Videlity doesn't work either.

And obviously 640x480 true-color is possible on my Falcon since as I said it works when I use HRTC.PRG, just not with Videlity.

(And just to clarify, I'm running under MagiC 5.11/NVDI 4.10)

Anyone have any solutions to this problem?

-Paul

>as the display manager.

This probably mandates releasing it in conjunction with FreeDOS, and
unfortunately has the possible problem of:
"So we need to write a bunch of video drivers..."

Any "graphics solution" has to deal with hardware to some extent or
another, and the solutions to that piece at this point are:
- If the hardware is old enough, DOS video drivers may be usable;
- Under DOS, one may use "BIOS" drivers;
- Under Linux, hope that [SVGAlib|XFree86|GGI] support it.

Alternatives essentially require designing something like GGI/X.

>(2) GEM within X. There could be a software layer that sits between
>a GEM application and X, allowing GEM applications to look like X
>client applications to X. In this way, it would be possible to run
>suitably recompiled GEM applications within X.

I'd reword that as "Provide a libGEM layer so that GEM applications
can run atop X."

And seeing as how <http://www.complang.tuwien.ac.at/nino/stemu.html>
STonX already exists, it should be entirely practical to do this.

The two things that the GPLing of GEM "buys us" are:

a) The ability to deploy STonX on the computers of people that didn't
have Atari ST ROMs that they could "dump" to disk, and

b) The ability to more closely couple GEM functionality with X, which
may (waving hands frantically) result in having more bits of the
"emulated" programs running as native UNIX code, which hopefully
improves performance and reliability.

>(3) It would be nice if some GEM applications could be freed -- I'm
>thinking especially of Ventura Publisher, the GEM version of which

>ran faster on an 8 MHz 8086 than the Windows version ran on a 16 MHz
>386. Something like that would be blindingly fast on a 300 MHz K6.

Contact Corel, as they are the current owners of Ventura Publisher. I
strongly suspect that the GEM apps that would get "freed" would be
apps that were already free.

For something like Ventura Publisher, even if everyone was happy with
the idea, there would be the challenge of:
a) *Finding* source code,
b) Getting permission to redistribute that freely,
c) Taking code that was often quite 68K-specific, and start slogging
through such issues as endianness, word sizes, and the likes.

I really think that "success" is more likely to involve using the
"GPLed GEM" to make STonX into a Better Emulator (e.g. - "Option 2)")
rather than either of the other categories.

Yes, but you only physically lost them.
I would say: take out that card, take hot iron or a sharp knife
(look out: I cut myself doing this) and make some space in the
plastic backside. Only a few mm and both the flatcables can be
plugged in (enough space between VME-card and connector) and take
outside between the space yoy made between plastic backcover and
metal frontplate of VME-card.

It looks like an awfull kludge, but who is looking at the backside?

Also I see you getting more concious about the ... virus {:-)

>apparent reason and corrupted data on the drive.

Oh, I see. Well, it's only done the "pause" thing once so far - where drive light stays on for about 20-30 seconds, then resumes it's read/write. And it certainly did it a lot more before the Nemesis was installed. And perhaps this problem might in part be caused by the ICD Pro driver software? (version 6.5.5) I did buy HD Driver 7 but I've been too busy playing around with Nemesis/Videlity to install it yet. I'll do that next week and perhaps the little problem will go away.

>Couple of suggestions here. Firstly make sure that you're modifying the
>correct modecode. Double line OFF, 40 columns, TRUE in the modecode box of
>Videlity. The 80 column mode is only available on RGB monitors.

Ok, I checked and I did have 640x480 set for the 40 column mode, so that wasn't it.

>Do not enable HRTC as well as Videlity - HRTC is simply a single mode
>version of Videlity & will interfere quite badly.

Yes, I figured that out early on.

>Make sure Videlity runs *after* NVDI in the auto folder.

Already did that from the beginning. :^)

>You should find a line in your MAGX.INF file like this :-
>
>#_DEV 5 26
>
>if the last number is unusually large then you've probably used Blowup
>before & the line needs to be changed to a valid modecode.

It was "27" but I have used the "soft" version of BlowUp in the past, so perhaps that was why (as you said).

>This one is 320x480x65536
>
>#_DEV 5 20

Did that; still no TC with Videlity.

>Assuming that's ok the best way to proceed is to delete VIDELITY.INF from

>VID_CONF. Select Double Line OFF, 40 Columns, TRUE in the mode code box.
>This should now display 320x480 and all you need to do is change the pixel
>size button to 1/4 to get 640x480. Save the modified mode (the disc icon
>at the bottom right)

Did this, then re-did my 16/256/TC modes, and after that everything worked as it should, thank you!

>ahem - that really does depend on the monitor. Basically, if you can
>display 640x480x256 you'll get 640x480x65536 though most people should be
>able to display a fair bit more. 720x528 displayed OK on an old AOC fixed
>frequency monitor so most should be able to display that.

So far the highest True-Color resolution I can get (without too much fiddling and testing) is 672x512 - but it seems a bit flickery. So I've set it to 656x496 which looks pretty good.

>Follow the instructions in the Hypertext using the frequency lock button
>to get TC modes better than 640x480 or try some of the modes in the
>library provided - extra modes may be found on my web site at :-
>http://www.users.zetnet.co.uk/dmurphy

I might mess with that more later, and I'll certainly take a look at the one's on your web site.

Thank you very much for your assistance!

I completely agree with you, a few months ago I also registered to this
little marvel which is the best alternative file selector (my own opinion of
course ...); far more compatible than Freedom which can lead to serious
crashes.
If you used Selectric (registered thru Denesh Babhuta services) you'll find a
really enhanced one if you cross to BoxKite which is still continuously
developped ...

Hi Paul,

I don't think ICD Pro vs. 6.5.5 is what's causing the problem. I have the same version, and I've NEVER had either of my hard drives do a pause like that. In fact, before I got ICD I had AHDI (which came with my Falcon), and I never had a pause using that either. So I suspect it must be each Falcon's "personality" that causes it to do that pause-thing. I've never had the problem either before or after the Nemesis installation. I'm using TOS 4.04. No Magic or NVDI. I'm glad you're getting things worked out, and that you got NEMESIS finally installed.

Bye,

Clayton Murray

No, if you want to specify options, you have to use them separately as
.ttp programs.

>Can't find it in the docs, just
>that they can be set with option -h for that and appearently they are, but
>I want to change that. Somehow Okami instructs them to work with -h, but I
>can't find where the instruction sits...

It's hardwired into the GEM module. Mind you, this whole business of
operating the auxiliary programs from within the GEM module is still
just a quick hack. You get the smoothest results - and you don't have
to press a key - if you install tos2gem.

>I've said this before, but IMO the new one imports/expires a lot faster
>than the old one... has this to do with the conversion of the indexfiles?

I never noticed they work faster, but it is entirely possible, since I
make little modifications to these programs continuously, and maybe
they add up...

I am very sorry about the confusion I have apparently caused. I simply could not deal with this matter effectively, since I have been busy for months to recover from a disastrous harddisk crash.

I will make an announcement about this in due course.

Don't use 24-bit IMGs for Magxdesk's background. You'll have to reduce
them to 8-bit, while at the same time care must be taken to preserve the
16 system colors. My experience is that GrafTool handles this the best,
although in some cases, depending on the original image, its dithering
isn't as good as Imagecopy's.

This is new for me but should explain more strange behaviour here.

On both TT's I have a Syquest44 Mb as SCSI ID=0

Gives me the possibility to always boot form a bootable disk.

But:
On the above mentioned TT I can start booting from the Syquest.
On the other TT I cannot.
Nearly never manege to bring the processing of the auto-folder to a
good end.
Also writing to that boot-disk gives total fat- an other terminal
errors.
But at the same time: that drive works ok when not used as boot but
as a extra normal drive.

Can anybody tell me more about : Syquest 44 Mb and ID=0?

Kenneth,

it showed up alrite.... in Okami. NOT in Newsie, whatever font I display
in there. Just to empty lines. Same as the follow-up from someone else.

Now I recall (better said: I know) there's two half-faces horizontally
(the ones you used were vertically) in the first 32 places of the fonts.
These can normally not be fetched thru' the keyboard. I don't know where
the other two sit. It shouldn't be too hard to write a routine for a text-
editor to display those two half-smileys when the 3 keys :, - and) are
struck in sequence. This is exactly what Word does...

(I used the CTL-Z feature in QED for this one, ASCII014 and 015).

> for use as a MagiC/Magxdesk desktop background image?
>
Paul,

the problem may very well be different versions of the (X)IMG definition.

First of, you should limit IMG's to 256 colors. Thing won't display IMG's
created by Graftool in TC rez (apart from that they're B-I-G).
Then the memory taken by those piccies is way too much to be justified.

Thing needs something like one meg or more for an 800x600 256 color
desktop IMG. Then it also needs quite some time to load the picture.

Referring to the wrong format: I take my screenshots with Sleepy Joe, in
256 color IMG. When I display those in some programs in TC mode, the palet
is all wrong. I have to do it in 256 color screen rez, then take them into
Graftool or Gemview and resave them, next they will be displayed correctly
in TC screen rez again. Don't ask me why, but those are the facts here.

Re your second Q, what are good files? You looking for hardware parts in
the piccies, or old cars, perhaps girlies w/o clothing? Look around on the
net, convert the JPG's/GIF's (I use Graftool/Gemview for that, sometimes
MGIF to get real nice 256 greyscale GIF's) and have them displayed by your
desktop program.

From: louis@holleman.demon.nl
Message-ID: <3722d188f8e2251@holleman.demon.nl>
Source record: 79956

Hi,

taking up this thread once more, I did a small test this morning.

First started Newswatch, and got the regular bunch in. I made a note of how long it took to get Comp.sys.atari.st in: 26 articles in 1 min 04 secs. The average speed Newswatch displayed was between 650 and 750 cps.

Next I started Newsie (had the DEFAULT.GRP set to take csas only, starting at the same article number), it took the same articles in 32 secs (the log displays rates between 1624 and 2693 cps for the individual articles).

Now since I'm using Newswatch it always struck me the speed isn't that high, also the harddisk makes quite a different sound when Newswatch is writing the articles to it than any other program doing write-to-disk operations, but how come Newswatch is that slow?

I was telling the other day about using Newsie for online news; I just did a session with Newswatch one time fetching the headers only for a binaries group: it took all the 285 headers of the articles, but I was online for quite some time.

Anyone knows a trick how to speed up Newswatch for fetching stuff??
I recall there is a safe mode option, I switched that one off some time ago, but it didn't make much difference, if any at all...

Uhhuh, doesn't work too well: I get the Fujisymbol here...

Probably because QED here is set to display 7x12 AES, which has the two
smileys, but other fonts show the Fujisymbol. Heck, now I remember: I
customized my 7x12AES once, perhaps I changed the Fujistuff into smileys
myself...

Kenneth, how did you get your smiley into the text???

BTW, when I set Okami to display TT-fonts, I get two empty square boxes.
Must be the mapping somehow...

But, I repeat this for programmers: it should be easy to write a routine
to display the smiley-character(s) once you hit :-) on the keyboard.
It has been done already... (be it the one-and-only goodie from MS)

Does your Afterburner use copyback or writethrough cache? If it's
copyback, try whether setting it to writethrough makes any difference.
It might be that MagiC has problems with the copyback cache, but that's
only a guess.

Hi Doc! ;-))

Hot news from the Internet, is that ICQ for STiK/StiNG is finally
available for the Atari!! Dan Ackerman has ported mICQ from Linux, and
it's fully working!

Get it from:

http://www.netset.com/~baldrick/

It's a TOS program, but Dan has included the source code so that someone
else could program a GEM version. I've tried it out and it seems pretty
good, and it's fine under MagiC 6 on my Falcon.

Cheers!

Doh! This proves I've got a lot to catch up on.. I've had a mess with
HDDriver and got a lead from a friend. The Zip works fine now and I can
easily transfer files from the iMac to the Falcon. Excellent :-)

Thanks to everyone that's replied & emailed.

If he's using the latest Nova-drivers (2.67) he can safely use the
copyback-cache. It's highly recommended, on my AB it speeds up
CPU-intensive stuff (rendering HTML in CAB, formatting long documents in
Papyrus, packing/unpacking) with 20-25% on average.

go to Katherine Ellis' pages at http://kellis.atari.org and
download her collection of 256-colour background .IMGs, they're superb
(in fact, I'm using one of them as my desktop, it's a picture of
footprints in the sand).

Unfortunately, it doesn't seem to want to work under Geneva/Neodesk.
Anyone got it working yet with this setup? I get the TOS window to
come up, the letter 'M' in the upper left corner, then four bombs. For
some reason right now, setting it to Multitasking Off like I normally
do isn't turning off the Multitasking mode for this program, too. I'm
totally baffled by that. Anyway, it works under TOS 4.04, so if I
absolutely have to I can use that, but I'd much prefer to get it
running under Geneva, especially with Multitasking on, if possible.

Hi Thomas,

yup, but lately I don't use the background image function very often.
First of, loading time (after a reset) is faster and secondly, I usually
only set the background to a neutral greyish color. In fact the most
pleasant screen to watch for several hours :-)

While I got your attention, how is the progress on Thing 1.28 or higher?
Can we expect something shortly?

Well, I fetched it from Dan's site, installed it - better say: ran the TOS
program which neatly displayed in the VT52 window and asked for a uin,
zero and next a password. This is on MagiC 5, btw.

So how to proceed on this stuff? One needs to register? Get an account?
Where, how? Dunno a thing about this ICQ, only that some friends (on PC's
of course) run this for quite some time and get pings and sounds like
"friend A is online", "friend X is online" and I gather they can chat or
send each other files, and even hide from each other. Some of them have
their ICQ number in their sigs, but I simply don't know how/where to apply
for such a thing. Is it free? You get the picture, I know nuttin'.

Howdy Pat,

yup, got the logging active. I'll switch it off, see what that leads to.

Got my stuff nicely running now, using Spawner standard, so all I do now
is start the Dialer, let it run, it starts the clockprogram to set my
systemclock if needed, next runs Popwatch and does what it's gotta do,
next runs Newswatch and does the same. After that I disconnect manually
and kick Dialer out. Meanwhile I can enjoy my coffee or make breakfast,
whatever.
After starting Okami it imports automatically, runs now decent in Tos2gem
so the keypresses have gone too... Erm, I'm gonna like this set even
better.

Yech, gotta work again tomorrow, still 12 PeeCees waiting to be configured
etc. Coming to grips with them now, I manage to get one completely done in
around 2 hrs, not bad huh? Then again, these are 400 MHz models. After
that the old ones (486-es, P-90's, 166'es etc) are coming in for overhaul,
upgrading and installing new s/w, that'll probably mean a lot more time
for one machine.

Does Win32 allow the user to define what component gets used at run time?
Can they then alter the component makeup and save it based on the class/instance
and or named context? What kinds of protections are put in place to ensure the
new component does not corrupt the applications memory space?

Yep me. On my Hades 060 Micq works just fine with Geneva/Neodesk (both the
last version).
I don't use Geneva/Neodesk very often so I can't tell you right now the
secret of my working setup.

This is my guess too. With LOGGING on Newswatch writes every move on HD
which explain why his HD makes another sound.
In optimal conditions I can get 4.200 bps with my 56K modem which isn't
that bad I think. Due the bad phone line I've I only get a 44000
connection with my ISP.

I'm not declaring Win32 as "better" than Linux, I'm merely saying that there are somethings that can use improvement in linux, and Windows has some good ideas that can be used.

Everyone here is ignoring the facts! Why don't you people be open minded! Linux is great-- excellent, but there are things that could be done better!

George MacDonald <gmd@slip.net> wrote in message news:37235B0A.718CF76F@slip.net...

Does Win32 allow the user to define what component gets used at run time? Can they then alter the component makeup and save it based on the class/instance
and or named context? What kinds of protections are put in place to ensure the
new component does not corrupt the applications memory space?

Give it an other try with your new modem, after connecting it to the
serial2/LAN port. The collect selected binaries by the headers almost
twice as fast the the normal newsmessages at approx. 3500-3800 cps.
As many Dutch say: "keeps you off the street" ;-)

1620. STinG FEE calculation

Newsgroup: comp.sys.atari.st
Date: 1999-04-25 00:00:00 UTC
From: mt@telebyte.nl
Message-ID: <7fvqot$mm1$1@rubens.telebyte.nl>
Source record: 80000

I have tried to edit my LOCAL.FEE file to let STinG calculate my phone costs. My phonecompany (KPN Telecom) calculates phone costs per second. Normal charge is 6.5 ct/minute. I'm paying 10% less (special offer) making 5.85 ct/minute = 0.0975 ct/sec. Since I wanted to see Fl. as currency in my DIAL.LOG file I should be able to fill in 0.000975 in the fee file for the charging cost and 1 second for the corresponding time. Well, STinG does not read such a value correctly. Then I tried 0.0975, with ct being the currency. No luck either. Then I tried 0.10 ct per second. This is not perfect, but it comes close, and now it works.

As far as I can see there is no way to include the 10 ct that I pay on top of these costs for each time I get connected, no matter how short or long I stay online, in the calculation that STinG makes using this LOCAL.FEE file.

It would be nice if the last results of these calculations would be shown in the dialer window after hanging up. Now I have to open and read the DIAL.LOG file to see my phone costs.

These 3 things could use a little improvement. Not really very important problems, I know. The STinG developer(s) should take this as a compliment. If a program is good, there are only small things to complain about.

If you consider PGA/CGA/EGA/HGC support enough...

(IIRC there was an 8514 driver as well that used IBM's Adapter
Interface, so I could use it with my beloved Image Adapter/A <grin>).

> - Under DOS, one may use "BIOS" drivers;

I hope you mean VESA. The BIOS video layer is ridiculously slow,
and I don't see how IBM ever meant it to be useful at all (although
IBM's Techinical Reference manuals so that applications should *only*
use the syscall interface to use the video hardware, which no-one did
because a syscall for every pixel is just *too* slow).

> - Under Linux, hope that [SVGAlib|XFree86|GGI] support it.

But note that GGI is platform-independent...

>Kenneth, how did you get your smiley into the text???

The four characters that forms a man with a pipe are in the built in
TOS character set. To get them into the text I simply opend the Geneva
ASCII table and whith a simple click they appeared in QED. Can't you do
that in Magic? :-)

>
>BTW, when I set Okami to display TT-fonts, I get two empty square boxes.
>Must be the mapping somehow...

I doubt these characters look the same in any other font than the built
in Atari monospaced one.

>But, I repeat this for programmers: it should be easy to write a routine
>to display the smiley-character(s) once you hit :-) on the keyboard.
>It has been done already... (be it the one-and-only goodie from MS)

Will not work as there is no "smiley character" in the iso character
set.

Any decent formatter will do it and most disk copiers will as well.
Fastcopy 3, in the public domain will do it.

What you need to do is ALTER the 'sector per track' and 'end sector'
values.

e.g. double sided (2 sides), 10 sectors per track (11 is pushing it a
little) and 81 or 82 tracks (end track 80 or 81).

Nope, not shortly. As some may have noticed, I was a bit envolved in
recent MiNT development, and I must honestly say that this made more fun
than working on Thing. But that doesn't mean I've dropped it, mind you.
But as I still plan some major improvements, things will take a bit. I
wouldn't expect anything before August, and don't kill me if it gets
even later.

Ciao

> initial installation of Sting 1.20.

I'm very glad to see that your problems have been solved, and that the
results show that the STinG 1.20 release can work on your system too.
I must admit that your previous results had me mystified, but this
is no longer surprising, since a hardware fault was involved.

> The new modem now is hooked into Modem-2, I ordered an adapter LAN-RS232
> and then I'm gonna use it at max speed from the LAN-port.

I'll be interested in a success/error report on that, since there are not
many who have used the LAN port for STinG. Most TT owners prefer to use
the 'Serial 2' output instead (which uses the same pins of the SCC IC).

If you have any problems making the LAN connection work, you may need to
make your own 'Serial 2' cable adaptor. The pinout follows below.

```
J902 Mnemonic DB-9 | J902 Mnemonic DB-9
---- -------- ---- | ---- -------- ----
1 DCD 1 | 2 DSR 6
3 RxD 2 | 4 RTS 7
5 TxD 3 | 6 CTS 8
7 DTR 4 | 8 SynClk Don't connect this pin
9 Ground 5 | 10 DSR_Out Don't connect this pin
```

As you can see from the above, making an adapter is fairly simple,
using a piece of 9-wire flat-cable and suitable connectors. But do
remember to cut the wire from pin 9 of the DB-9 connector, since
that is the 'Ring Indication' signal from the modem. A signal that
does not exist on the 'Serial 2' interface. The SynClk and DSR_Out
signals on J902 pins 8 and 10 are not intended for use with normal
asynchronous modems.

Naturally you may also want to make use of the 'Serial 1' interface,
so here follows the pinout for it.

```
J600 Mnemonic DB-9 | J600 Mnemonic DB-9
---- -------- ---- | ---- -------- ----
1 Unused | 2 Unused
```

3 RxD 2 | 4 RTS (NB_1) 7
5 TxD 3 | 6 Unused
7 DTR (NB_1) 4 | 8 Unused
9 Ground 5 | 10 Unused

NB_1: DTR and RTS of 'Serial 1' are not really implemented. Instead
they are simply connected through a 200 Ohm resistor (each) to
the +12 Volts supply.

The above should make it clear that 'Serial 1' is not useful for a
modem connection, though it can be used for local networking. STinG
itself does not require any (here absent) handshaking lines.

Finally, since you did mention three connectors in an earlier post,
let me emphasize that the third one (I assume you mean J602) is not
suitable for direct connection to any normal RS-232 connector. It
contains two 'leftover' I/O pins of the TT-MFP, which use standard
5 Volt logic levels, not the +/- 12 Volt levels of RS-232.

NB_2: Pins 1 and 3 of J602 are connected directly to the TT-MFP pins
25 and 26 (IO0 and IO1), without any other protection than a
2.2 kOhm resistor each, connected as +5 Volts 'pullup'. Do not
play with these without knowing _exactly_ what you do. Damage
to the MFP is likely to lock up the system !

NB_3: All pinout information above is taken directly from the original
Atari TT schematics. Component numbering may possibly differ in
some machines though, since many motherboard versions exist.

> Sofar I had regular connections at 3500 cps with Newsie, aFTP fetching a
> 600k file at 2975 (including the 3-4 interrupts in the connection to my
> ISP) and the rest looked OK as well.

This sounds fairly normal for the DTE-DCE speed used, but do not expect
all clients to improve equally much at higher speeds. I'm afraid 'Atack'
still optimize their stuff for MiNT only, so under STinG I have not gotten
very impressive rates for aFTP. That may possibly be due to my 'tweaking'
STinG settings to optimize CAB performance though. (Opinions on this ?)

My own results with the latest (?) aFTP 1.51b are really bad for uploads.
Somehow it seems to block the transfer rate at a little over 1000 cps, no
matter what bitrate I use (even at 153600 bps with local server). Weird !
No other FTP client shows any similar symptoms, and I've tried the lot...

> Fetched the latest Aniplayer as well and it does a fair job on MPEG's now.
>
Good, I'll go check it out myself too then.

----- snip ----- re: the 'Multipoint virus'
>
I'm afraid this is one of the many ailments where most attempts at a cure
merely serve to spread the disease to a wider range of potential victims.
Sort of like pre-Semmelweiss hospitals, you know, that actually lowered

the chance for survival of most patients.

I see only one solution: "Sterilize the quotes !"

PS: Don't panic !
Note that I wrote "quotes" and not "quoters". ;-)

Couldn't u use Alternate+32 on the numeric keyboard to emulate that " " thing?
Or is the alternate key defective, too?

Btw, it should be possible to hook the keyboard from any ST to the TT, might
just require some soldering.

Hi,

well, tried this ICQ.TOS a bit further: established a connection, started ICQ and issued a 0 for a new UIN. Next gave the password I want, a second time and next the screen displays "Creating Connection", then "Sending Request" and after that it hangs. Blam! Need the resetbutton to get out.

So for the moment: no (further) go.

Hi,

well, turning Newswatch' logging to off, raised the average cps rate from around 700 to 1200-1300. That's on a 38400 connection. Gotta wait for my LAN-RS232 cable to get max speed. And indeed, the "strange HD sounds" disappeared Martin :-)

>> SIMMS.
>
>And what did it push into ? The CPU socket maybe?

I do remember various STFM motherboards had their processor on a socket, and this could be removed, the adapter board plugged into said socket and the processor placed onto the adaptor board. However, there were many revisions of the STFM motherboard, and unfortunately, mine was one with the processor pre-soldered into the board. ST Format, in one of their features on upgrading ram, actually had pictures of all these different boards, some with socketed CPUS, some with soldered CPUs. With these boards, you actually have to manually solder your own socket on top of the processor, and plug the adaptor connector into the socket.

There was also an additional adaptor which you could use to plug the MMU adaptor over the MMU chip itself if the MMU was soldered into the board. Believe, many trips to MAPLIN buying sockets (you have to BEND the legs over the processor, then solder the legs of the socket onto the processor!!) later, I had a working STFM with 1MB ram. I was well chuffed :o)

Bottom Line : If it's a socketed processor, you're off to an easy start. If not, I hope you're good with a soldering iron :o)

cheers
Asan

1648. MagiC Desktop (background) IMG files

Newsgroup: comp.sys.atari.st
Date: 1999-04-25 00:00:00 UTC
From: Nurmix@NO_SPAM_MEsocal.com
Message-ID: <7ftsag$ab6@enews4.newsguy.com>
Source record: 80092

Two questions regarding the desktop images used with MagiC 5/Magxdesk:

1. According to Image Copy 4, the format of the IMG files used for desktop backgound images is "IMG (extended)". Well, I have a decent selection of IMG backgound pics to use with MagiC already, but I tried converting some cool pics from a CD ROM (small JPGs designed for use as web page backgounds/textures) to the "IMG (extended)" format [and according to Image Copy, that's what they were] but they DO NOT work with MagiC - I just get the standard solid colored desktop - no picutre. What's the secret?

2. Where can I find some good 256/true color (not 16 color) IMG files suitable for use as a MagiC/Magxdesk desktop background image?

1649. Disappearing Mouse Pointer?

Newsgroup: comp.sys.atari.st
Date: 1999-04-25 00:00:00 UTC
From: Nurmix@NO_SPAM_MEsocal.com
Message-ID: <7ftsah$ab6@enews4.newsguy.com>
Source record: 80093

I know I've seen this mentioned before, but isn't there a little ACC or AUTO program that will enable the mouse pointer to re-appear after it mysteriously disappears? This seems to be happening to me a lot now since I started running at 800x608x256 with Nemesis/Videlity - after running a TOS program in a window. As soon as I finish and quit the VT52 in a window program, no more mouse pointer.

Louis,

Re your query on the TT serial ports, the connections between the
motherboard and the 9-pin D plugs are made with 9 core flat cable and
the connections are made by insulation displacement, so the
connections to the pins are

pin 1 (top row)
pin 6 (bottom row)
pin 2 (top row)
pin 7 (bottom row)
and so on across the flat cable.

It should not be too hard to lash up replacements.

Hello Hello

Nah, that's wrong:

Try again:

Looks a bit better, uh? It's the devil smilin'...

Another one:

Wow, it's Ronald's VirusCat... or Captain Wall Russ?

PS: don't use the Atari systemfont Referee-with-a-pipe for this!
(If you got this one, use Rufus ANSI font to display! Looks really nice...)

One more go then: -
-

Hey, it's Fatman! or SquareHead... me, after another day watching the
screen...

The moral of this story: I checked nearly all my GDOS-fonts, only Atari
systemfont and I believe Monaco/Ocanom display the man with the beard. Some
charsets have two parts of the whole thing reversed.

Some charsets display kinda ANSI graphic stuff.

Rufus ANSI and another one display the round smiley.

Conclusion: this smiley is pretty much useless if you ain't using
Atari Systemfont or Rufus ANSI. Let's just stick to :-)

Hi. IIRC, that is in Atari BASIC. Its a peek/poke command that shows
it up. Seems that some Atari programmer decided to immortalize him-
self... ;-)

PS I'm thinking I first read about this in Compute! magazines "Atari
Outpost" section, but its been so long I could be wrong... ;-)

Oh certainly, but you'll need the special drivers for it, which you can
download from the apple website.

Am I right in thinking that this is a wind-up? AFAIK a mouse mat is a bit of
rubbery stuff you move your mouse on, and that you don't actually NEED it to
be compatible with anything, apart from your desk and your tastes.

cheers
Asan

Well, yes I had the Marpet (Thanks for reminding me!)

But the plugs only worked if your chips were socketed already. For the poor souls like me with soldered chips, we had to solder a socket over the video shifter, but thankfully there was a plug adaptor for the MMU.

cheers
Asan

The "smiley" characters are ASCII 28, 29, 30, and 31. These are in the
range < 32 AND THEY SHOULDN'T BE USED IN INTERNET MESSAGES. But all
news and mail readers will leave them as they are, and since they
aren't apparently used as control characters, they will come through
unscathed.

partial correction, AHDI 6.03 it only seemed to support IDE 0/1 and scsi
unit 0 with no way of configuring more it's a long time since I used it
but at the time I had bought a Syquest 135 which I had set to unit 4 this
worked fine on my STE but with less knowledge then, I spent several
nights trying to get it to work on the Falcon ,only after setting it to
I think 1 which was Syquests way of saying 0 did it work. during this lot
I was futher confused with a Mini S scsi drive I had also bought from
Systems Solutions as the device selector was wired wrong ie 5=3 and so on

Looks like one of the AUTO programs or ACCessories is not STE
compatible. Try renaming each of the AUTO progs to .PRX and the ACCs to
ACX until you find the culprit.

Hi all,
I have a problem on the Download module when I want to download
a file when I am on line,the one that downloads in the background
while you do something else,I right click and run down to the download
bar and nothing happens.
All the modules are in the folder,I have done a new re-install,also the
Hotlist check module is not working.
I can download with a left click on the mouse and when the file
selector comes up I can send it to the drive of my choosing,but it is
the download that runs in the background thats the problem,it simply
does not come up,
any ideas anyone,
thanks,
Rob.

>Canï¿½t follow that. Use STinG 1.51ï¿½ since 3 days with MagiC6.
>Perfectly, same with 1.50

There is some misunderstanding here. He spoke of 'aFTP 1.51b', and going
back to the older 'aFTP 1.5b'. The new STinG version is 1.20, so the version
numbers that you mention do not exist yet.

>Iï¿½m replace all old items with all new items out of the new archive.
>Thatï¿½s all.

In referemce to STinG 1.20 installation (I think that's what you meant),
that is not quite all. It is vital to remove any old STXs that were not
replaced by any new ones in the new release.

Mostly those were just empty port driver 'skeletons' that have no function,
but they do have the _old_ port driver structure, which makes them cause
the _new_ STinG to bomb. Only new STinG modules will work right with the
new STinG kernel. The same also applies to STING.CPX, and the dialer.

Also, as usual when updating CPXs, it is necessary to reinitialize their
settings and save these settings into the new CPX files. I strongly
recommend using the shortest STinG 'delay' possible (10 ms) for all
machines that can handle it. For slower machines 20 ms will be a good
compromise, but higher values should be avoided.

I mention these things here again because forgetting some of the above is
the most common mistake made by users updating their STinG installations.

Hi there!

Please exuse me as I've never tried to do anything like this before.
As no doubt a number of you might be somewhat tired of the glut of glossy computer magazines all centered around the flavour of the decade, most notably Windows, a friend and I have come up with the idea of starting up an alternative computing newsletter.
If we're successful it might even turn into an actual magazine, dare we dream. I'm still in the process of deciding what exactly to focus on but I do know this much: I want to cover hardware and software being made or in development for such old die-hard classics as the Atari ST and Amiga. Heck, there's a company out there what's still making new hardware for old Commodore 64s and 128s. There's even people making new games for old videogame machines. That's the sort of thing we want to cover.
So, I figured I might as well ask you gentle readers on these NGs, since I recall at least a few of you out there are hardware or software developers. I would like to include adverts! I promise to give you more details as I work things out, if you respond. I thought my best bet would be to start scoping around on these groups since this is where a lot of stuff gets hashed out.

Thanks in advance!

Mono. It's what you need to use ST-High resolution (640*480, 2 cols). They are generally a very nice paper white display, and this res is the minimum for a fair few recent or "serious" apps (eg Papyrus, Calamus). Also essential for Cubase and Notator, the big 2 music programs for the ST.

Most games won't work with a mono monitor (though there are some which will, Monkey Island springs to mind).

If you are thinking about getting one, go for it if the price is right; you will have by far the most comfortable display for most things apart from games or colour graphics work.

1688. MagiC, STData and STDesign

Newsgroup: comp.sys.atari.st
Date: 1999-04-26 00:00:00 UTC
From: tcjspencer@zetnet.co.uk
Message-ID: <3724e70f$0$494@news.zetnet.co.uk>
Source record: 79932

First off I know these are old programs but they are still very good and I have years of info stored on STData.

Basically STDesign is for creating the record format to be used in STData. STDesign works quite happily in MagiC, STData tells me there is insufficient memory for it to run. I cannot understand why one will work and the other won't.

I have tried endless permutations of the settings in show info and applications such memory limitation, operate in Single mode etc. etc. as well as changing the flags, nothing works. All that is left is to try setting the parameters. I haven't a clue how to do this, whether that could affect anything or even really what it means.

Does anyone have any suggestions please? It is the only program that I use regularly where I have to disable MagiC.

Yep, I meant aFTP 1.51B, not STinG. STinG 1.20 is solid here and has
been from the get-go. So far aFTP, however, doesn't look pretty. :)

Thanks for all the input. I dumped the old aFTP config file and created a
new one from scratch and I'll try it again next time online.

And, like it or not, USB for "low" speed and firewire for highspeed
devices is the way of future peripherals. Apple already made the move
because they have a more controlled environment. The Intel/MS side has
been trying to make the move; they just haven't managed to get there, yet.

The move is to closed boxes and serial interface peripherals... kind of
Deja Vu all over again. ;-)

Tacky replying to my own message, I suppose, but...

With the newly created config file and Logging turned OFF (aFTP had
trouble creating the log file for some reason) all is better. I don't know
what the problem really was but it appears much better, now.

I'll investigat the Log file issue sometime, not a priority right now.

Thanks,

> the standard solid colored desktop - no picutre. What's the secret?

I haven't used Imagecopy to create these (GEM-view is my choice) but I have
noticed that if when dithering JPEG's or ANY image down to 256 colours, if
the image contains a 'compressed' palette of less than 128 colours, magxdesk
won't display it, or if the image is a 15/16 bit colour IMG it won't display.

I use GEM-view and I always choose 'Octree' colour selection with true-colour
images if I need to convert them to 256 colours. I have some lovely 800x600
JPEG scans of some high-country areas I went bush-walking in once, and they
look photographic in 800x592x256 colour mode...

I tried it out this afternoon and found it's pretty good. Not as
nice as Freedom 1.5 for my own tastes, but it appears to be pretty
solid. And yes, it does support long file names.

I suppose it depends on which extension board you are using. The
Marpet, for instance, has two 'plugs' which fit onto the MMU and the
Video shifter. One picks up the DATA lines the other the ADDRESS
lines.

Kenneth, sure can, but:

Appearently only the Atari systemfont has it that way. I'm using all kinda
fonts accross my system, where QED uses 7x12 AES and Okami uses Rufus
ANSI. The latter displays a smiley alrite, but not the man with the beard
showing yellow or red cards... it's a smiley consisting of 4 separate
parts. Lotsa work to create one quickly :-) That's using CTL-Z in QED.

Let's C, should be able to do it myself:

Gawd, this is not working like it should be: a quick remark :-)

Martin,

us nitpickers must have something to nitpick about...

Why don't you use the ISP-fee option to add your ten cents?

You may run a login batchfile where the last one would be
!run QED loaded with "DIAL.LOG" displayed at the end.... how's zat?

Hej Ronald,

this was the info I was waiting for, the three pin layouts for J900, 600
and 602...

Thanks a lot! All I now need is some flatcable, two connectors and
preferrably another connector to hook up to the J-connectors, otherwise
I'll have to solder around a bit. Next a hacksaw to improve the TT-casing
a bit and off we go... :-)

Again, tack sa mycket!

Depending on your TOS version, HSModem is either needed or strongly
recommended.

> What is this and where can I get it??

HSModem is a serial port replacement driver. It replaces the built-in
driver, fixes some bugs and gives you a more reliable connection.
Contrary to common belief, it will not break the 19200bps barrier on an
ST.

You can get it from just about any FTP site, or the Quick FAQ. Just make
sure it is running correctly: DRVIN.PRG first in the AUTO folder, then
MFP.PRG, that's all you need from the HSModem package on a stock STE.

The STX files are the network drivers that come with the STinG package.
They should go into the STING folder that is indicated in the STING.INF
file.

What the heck are you still doing with STiK. It's old and it only
supports the SLIP protocol that hardly any provider uses any more.
Get STinG immediately! Links and instructions are in the Quick FAQ.

> Is it Falcon compatible ?

STiK is Falcon compatible, but it's probably not compatible with your
provider.

Try DCFormat or any other 3rd party disk formatter. There are several
ones around on the major FTP sites. However, and disk modified like
that will not be DOS compatible anymore. It will not be recognized by a
PC or a Mac, and therefore is not suitable for tranferring files.

1719. Atari ST SoftWare Sale! $15 Titles!

Newsgroup: comp.sys.atari.st
Date: 1999-04-27 00:00:00 UTC
From: Bravo Sierra Computers <bensmith@teleport.com>
Message-ID: <Pine.GSO.4.02A.9904272232050.13295-100000@user2.teleport.com>
Source record: 79799

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

I've been working hard on adding more Atari stock to my inventory. I wanted to have everything in place by April 15th for those of you with Tax refund checks. Still, I've done pretty well. I'm having a "Come spend your Tax Refund in my store event!" I have NEW Atari ST SoftWare for sale! These $15 titles are marked down to $10. So even though the *NEW......$15 ST Software says $15, it's really $10. Each one is "*NEW" and most are ShrinkWrapped! You'll find these titles in my ST SoftWare Catalog. Feel free to take my Catalogs and see what new HardWare, SoftWare, Books & Accessories I have for the Classic Atari 8 Bit and Atari ST.

<h3>Click for WebSite!</h3>

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

Atari ST and Classic 8 Bit, Hardware, Software, & Accessories. (503)256-9974. Hallo Derryck!

DC>IME NEWSie remains the quickest way to download newsgroups.

As far as Usenet is concerned: perhaps.

I'm watching this group and many others through MausNet (TM), which is a Network of around 100 BBSs located in Germany, Austria and Switzerland. I just got 322 messages in 28 newsgroups within 84 seconds online time. And the newsreader (CAT 3.05) took another minute to import all of these messages into it's database. _That_ is what I call fast :-)

I'd still like to pin down the cause of my problem with selecting new dial scripts from within the dialer. It takes several attempts before it will actually select the script that I've d/clicked on from the file selector.

This is a Falcon running MagiC 6 with Freedom, same problem with Freedom disabled.

Quite agree.

There's a couple of cosmetic changes - it would be nice to be able to select a
new script via a popup a la NEWSie - plus I'd like to see the function of
the STinG internals CPX subsumed into the dialer or its script.

You can use this hard disk drive with HDDRIVER and the Mac as well as
the Atari if you partition your drive DOS compatible. HDDRIVER/HDDRUTIL
offers several options for DOS compatible partitioning. Note, however,
that you can't boot from a DOS compatible drive.
There is no way to use a Mac-partitioned drive with the Atari.

Do you mean that the filename you selected is not placed in the
"Dial script :" filename field, or that the settings from that
file do not take effect as you wish ?

My further answers below assume the latter.

>This is a Falcon running MagiC 6 with Freedom, same problem with Freedom
>disabled.

I also have a Falcon running MagiC 6 with Freedom 2, with no such problem.
I suspect this may simply be a misunderstanding of what the selection of
the file should do, and when.

Since the I/O port for dialing is not normally active before dialing begins
some config data is not activated at the time it is read in, but will be
used when dialing is started.

Also, the filename is not saved for future startups, so the next time the
dialer is restarted it will still load the scriopt named DIAL.SCR .
(This is quite similar to how the standard desktop uses NEWDESK.INF.)

This means that in order to load changes so that they remain effective for
future runs, without having to reload each time, you must save the changes
as DIAL.SCR .

Please note that Videl Inside also handles Falcon hardware using an
accelerated frequency on the Videl : For example, I am running my Falcon
in 800x608 at a frequency of 79 Hz, thanks to my CT1 accelerator, which
sets the Videl to 50 MHz instead of 32.

Hello everyone,

unless I am mistaken, my TT's hard-disk is dying. After a couple
of hours of usage, any time I access it, it spins up and down, or
even comes down to a full silent stop, then reboots seconds later.

Has anyone ever encountered this? Have my worst fears materialized?
Please help. Thanks.

1736. BigDOS question(s)...

Newsgroup: comp.sys.atari.st
Date: 1999-04-27 00:00:00 UTC
From: lvzon@bio.vu.nl
Message-ID: <7g4c0d$9bq$1@feresa.bio.vu.nl>
Source record: 79860

Hi there,
two little questions for those of you who managed to get BigDOS 8 to work properly on a Falcon (using the BIGDOS_F.PRG, the Falcon executable, obviously):

1. BigDOS has to be placed at the start of the AUTO-folder, but seems to skip all programs that should be loaded after it and directly jumps to loading ACC's. I tried this both on harddisk and on floppy, using either CBHD or a demo version of HDDRIVER. It keeps skipping the rest of the AUTO-folder. So, how do I get it to work properly?

2. I tried installing an IDE drive containing an MS-DOS partition.
It gets recognised by AHDI, HDDRIVER and CBHD 5.02 (which doesn't like IDE drives much, so it then goes on to generate a lot of gibberish and a sense-error). Anyway, the IDE _drive_ gets recognised, but the partition can't be found, not even with the HDDRIVER (demo of version 7, I think) and BigDOS combo... Anyone?

Thanks,
-=Levien

1739. FS: Complete Atari 1040ST system

Newsgroup: comp.sys.atari.st
Date: 1999-04-27 00:00:00 UTC
From: bdove@mks.com
Message-ID: <7g4j85muv1@news.mks.com>
Source record: 79863
Cross-posted to: uw.forsale,comp.sys.atari.st,rec.music.makers.synth

I have the following Atari items for sale. I'd prefer to keep this all together as one packagae, but I'll entertain splitting things up for the right offer.

Hardware
----
1 Atari 1040 STf
1 Atari 1040 STfm motherboard and keyboard (not working -- missing powersupply, case)
1 Atari SC1224 colour monitor
1 Atari SM124 high resolution monochrome monitor
1 Marcus Marconi trackball
1 BMD Atari/Amiga mouse
1 Wico joystick
1 Supra external 2400 baud modem

Software - Original (All include docs unless otherwise noted)

Pirates! (in box)
Their Finest Hour (in box)
Wrath of the Demon
Degas Elite
GFA Basic 3.0
Star Glider 2
Alternate Reality - The City
Populous
Stac - The Atari ST Adventure Creator
Sun Dog
Dr. T's Fingers v1.0
Tom Hudson's CAD-3D
Dungeon Master
Atari USA Language Disk

Software - Cover Disks

ST FORMAT - 23,29,30,32,34,35,40
STart Vol. 4 - 11,12
STart Vol. 5 - 1,2,3,4,5,6,7
Atari ST Review - 1,2

There are also 52 other disks containing various programs (including shareware) such as: MiNT, games, programming utils., midi sequencing,etc.

Location:
This package is located in Waterloo, Ontario, Canada and ideally I'd like to avoid shipping as I've only got original boxes for a few peices of hardware. Again if the price is right I'll consider shipping.

Price:
I'd like to get around $150 CAD or best offer.

I suspect those who may benefit most from the new GPL'd GEM would
be those using it now on older hardware (e.g. Atari ST). They can
trweak it now.

> You're probably right with this. "Whatever that BIOS-like level is

Miauww miauw,

My cat is many things but is not repeat not a virus-cat.

But I agree, there is some likeliness between the symbol you produced
here (Another one symbol, see this message) and my cat.

When the cat licks some butter from uphigh with here tail up, then
the symbol mirrored (up/down) looks a bit like her.
Needs some fantasy though.

Classic problem for Pagestream... you go in and get the program to recognize a bunch of fonts.. all is going well.. you shut down the program (even after you've saves the preferrences)... you come back later, and Page Stream forgets all the fonts you set up!

What is the way that you get Page Stream to remember the fonts you set up ... to make it stick?

1755. ANSI / RIP Term for Atari?

Newsgroup: comp.sys.atari.st
Date: 1999-04-27 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <372575C5.2ACD@geocities.com>

I love the BBS scene.

I was wondering what Atari terms programs support ANSI (besides Freeze
Dried Term) and if any supported RIP term?

1756. Importing graphics on Page Stream under MagicMac

Newsgroup: comp.sys.atari.st
Date: 1999-04-27 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <372576C9.42AD@geocities.com>
Source record: 79880

Found that Page Stream works fairly nicely on a Magic Mac 68030
computer.. though the monochrome screen isn't completely right. The
program runs impressively fast.

Aside from figuring out how to get the program to remember the fonts..
which is a common problem, it does not seem to accept GIF files that a
regular Atari set up has no problem accepting. This caught me off guard
since I thought a Mac based Atari setup would have less problems
importing GIF files.
So is there something that just needs to be adjusting in either
MagicMac or Page Stream to get it to accept GIF files?

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.st.programmer

I found this page during one of my web browsing sessions. It seems
these guys have developed a parallel port cable and drivers to run
IP over 1284 (parallel port), and the adapter works with PCs, Amigas
and Ataris. The cable is called Smartnet98. Has anyone out there
actually tried this thing? If you have one of these cables working,
I would like to know how well it works...

Here is the link: http://rcswww.urz.tu-dresden.de/~sb227788/

Thanks,
Chris

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 04/19/1999

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection is currently on-line! Unfortunately, there is no
list for this system (cartridge and CD based systems only).

I have the following Atari ST software for sale or trade.

Unless specified, all items are *NEW* and are still shrinkwrapped.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped! Includes box and manual]:
$ 4.00 Art & Film Director (Epyx) -- $4.30 shipping, due to
weight, counts as 1st item
$ 3.00 California Games (Epyx)
$ 3.00 Death Sword (Epyx)
$ 2.00 Devon Aire (Epyx)
$ 2.00 Dragon Scape (Free Spirit)
$ 2.00 Final Assault (Epyx)
$ 3.00 GFL Football (Gamestar)
$ 2.00 Lands of Havoc (Antic Software)
$ 2.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 3.00 Metro Cross (U.S. Gold / Epyx)
$ 3.00 Paint Pro (Abacus Software)
$ 2.00 Prime Time (First Row)
$ 3.00 Quadralien (Spinnaker)

$ 3.00 Renegade (Taito)
$ 2.00 SwiftaR (Accustar)
$ 3.00 Techno Cop (U.S. Gold / Epyx)
$ 4.00 Warship (Strategic Simulations, Inc.)
$ 3.00 Winter Games (Epyx)
$ 3.00 World Games (Epyx)
$ 3.00 World Karate Championship (Epyx)

SPECIAL: Buy one (1) of each listed title and receive 20% off.

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.20 for the first game and $1.10 for each additional game. Shipping for hardware and accessories depends on the distance that the order must travel. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside

the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

Ah. Eric R. Smith stands up...

MiNT (which ultimately stood for "MiNT is Now TOS") was one of the
coolest projects out there, at one point... More consciously
POSIX-emulatory than Linux, at the time.

And useful for my grad work at the time, for much the same reasons that
it was created, namely as a better substrate via which to run GNU tools
on the Atari ST...

I've always wondered what happened after Atari's computer business did
their "crash & burn;" I'm glad to gather that you didn't get roasted "to
death" by the experience. Doubtless there's some interesting stories
there.

You're probably right with this. "Whatever that BIOS-like level is
called that lets you ask an SVGA card to display things, and hope that
it'll work."

>> - Under Linux, hope that [SVGAlib|XFree86|GGI] support it.

As are SVGAlib and XFree86; they all *can* run on systems other than
Linux. Not that it universally happens a lot...

Nick, the way I see it it would be not very logical to do...

Sounds good as long as you only fetch the mail and news. What if you
decide to go FTP-ing, or surfing? OK, you can de-activate the batchfile
before connecting with Dialer, but I found myself already on occasions
that I wanted to use CAB for the session only, I forgot to de-activate the
batchfile and the whole bunch started first.
Using several batchfiles won't work since it's laid down in DIAL.SCR and
that's what the stuff reads upon starting.

The same applies when you want a prg to hangup. When? Upon completion of
the mentioned prg's, then what if you decide to go surfin' afterwards?

After somuch time of inactivity? Then what while surfin', you read
something so the line is inactive, next you wanna go further and meanwhile
Diaer hung up... :-(

I haven't found out exactly what the new Sting's advantages are, except
for the fact that the provided TCP.STX gives me high speed indeed. I
recall with the update of 1.10 to 1.12 or from 1.12 to 1.15 I needed an
old STX to get decent speeds.

Finally, from what I gathered Peter lost his ISP account so he isn't able
to reach us here. Good thing someone took over :-)

Pascal, you're dead rite... I've got an early Atari mag lying over here,
advertizing the 520 ST, incl. SM124, mouse, 500 kb diskdrive for a little
over 3000 Dutch guilders in 1985. That would be around 1500 USD nowadays,
using today's exchange rate... power without the price?

If my memory serves, your PGS2.INF file is either corrupted or marked Read Only. Try renaming it to .INX, running Pagestream, setting fonts, and saving settings.

Once that works, you can either reset all your settings back like you want them & re-save the new settings, or you can load both .INF/INX files into an editor to look for and repair what broke the .INX file.

>new Draconis package. Don't hesitate to post a message !
>

I'm a registrated user of Draconis pro but I don't use it because:

1) It comes with his own TCP/IP stack which means you only can use Adamas drtelnet, drftp and Marathon (e-mail client) with that stack. There are rumours that the Draconis package will support MiNTnet very soon now.

2) On my Hades running MiNT/N.AES it's rather unstable.

3) Apparently Adamas supports only 256 colors. On my system the colors are totaly wrong when I use 32k or 64 k colormode. With 24b and 32b colormode things are even worser.

4) Only partitial HTML 4 support

5) Rather slow

For the moment nothing can beat Cab 2.7. I've tried Wensuite too but this browser is even worser. Wensuite is damned fast but that's all. Crashes all the time, creating nameless dir's, doesn't understand lots of HTML-tags, etc.

I know your are talking about Sting/aFTP but for your information I don't
have the problems you've mentioned above with the MiNT/MiNTnet version.
Beeing the maintainer of the Belgian ftp-site I do lots of uploads. I
usualy get a upload speed of 3500 cps (with a V90 modem, 44000
connection). I've once uploaded 80 files (4.4 MB) in one session.

I'm going to be porting GGI/KGI to OS/2 once it's stable (and once it's easier to integrate with other OS/2 window-system related projects of mine). So there will be at least three platforms (Linux kernel, BSD kernel, and OS/2).

If anyone is interested, mail me at <jerodd@usa.net> (address from which this article was posted doesn't seem to be working).

Cheers,
Joshua.

Right, I'm still on 1.4b4 for both Sting and MintNet, but both upload just
as well as they fetch. Previous version no probs either. Haven't tried
them on my new modem though...

Hi,

the old Opusterm was a full ANSI supporting terminal prg. No switchable fonts however, it got stuck to its own built-in font. Character-translation was unsurpassed, completely user-definable.

My last term prg was StarCall, perfect on ANSI-boards (in color).

Didn't like Flash, Stalker (mainly because of the needed buffer prg STeno, which in turn had to be set to a predefined buffersize. It was a fast one, though). Even bloody old Rufus worked with ANSI, provided a decent font for that (came with the prg) was installed. Rufus was highly unstable and caused the one and only HD-crash I've had over here. 850 megs, 4 partitions, C and half of D wiped out beyond reconstruction, the rest of D partly corrupted. Rufus was sitting on C and after the crash went straight into the bin.

Didn't RIP honour its own name? I recall having seen a very early RIP version for Atari years ago, but that was all I ever saw. If my memory serves me well, it didn't even work...

1790. Floppyshop's Final Farewell

Newsgroup: comp.sys.atari.st
Date: 1999-04-28 00:00:00 UTC
From: Steve Delaney <floppyshop@cyberstrider.org>
Message-ID: <7g7mfbhgq1@news1.cableinet.co.uk>
Source record: 79757

Hi All,
Welcome to the final message from Floppyshop. As you all know, we closed our doors for the last time in mid-February. A lot has happened since then and that's really why this message has taken so long to compose.

When we announced our closure, we did not know what sort of reaction to expect from our customers. We were unsure as to whether we would be greeted by complete apathy, a trickle of nice letters or a total backlash of angry letters from those who considered us to be leaving the sinking ship. What we did get was none of the above and we were literally rendered speechless (those who know Steve will understand just how difficult it is to do that)!

From day one, we were inundated with orders. Naturally the knock-down prices were a major contributory factor, but there was more to it than that. Customers were buying up everything they had been intending to get round to purchasing one day, and they wanted to stock up while they could. This mad rush only really slowed down after our official closing date of 30th January 1999, something which certainly surprised us! It showed a high level of trust from our customers, many of whom had been with us for 10 years or more. Nobody was concerned about us disappearing without trace and failing to supply their goods, like so many others in the Atari market have done. Accordingly, trust like that has to be earned and all orders (even those which arrived after our extended closing date of 12th February) were honoured up to the time our PO Box closed down.

Equally important were the messages of support we received from customers during the course of the sale. They ranged from brief telephone calls to lengthy letters and emails, all of which were most welcome. The number of Atari users who took the time to thank us for the services we had provided for them over the years and wish us well in our future exploits, was phenomenal and indeed totally unexpected. From our point of view, we were only doing our job and we were not looking for gratitude, though such messages were well received and most appreciated. Please allow us to express our gratitude to you. Without an Atari Community in the first place, Floppyshop would never have existed. It was an important part of our lives and the memories will remain with us always.

Many customers expressed concern about what would happen to our products after we closed down. We too had our doubts and were delighted when several companies and individuals approached us with a view to taking over remaining stocks. We are pleased to announce our surplus stock of commercial products and the distribution rights to most of our CD-ROM compilations have been acquired by our good friend Paul Glover at FaST Club. Paul was probably the first to start up a PDL shortly after the release of the ST and has a longer pedigree than us! His expansion into commercial software and magazine

publishing has made FaST Club a household name worldwide. We would like to thank Paul for ensuring these products remain available to Atari users. Similarly, our Public Domain/Shareware Library has also been saved from extinction! In this case, our thanks go to Andrew Plumridge of Falcon's NeST PDL for his brave and salient rescue of this fine collection (well we would say that!). Andrew has pledged to update and expand the PDL with catalogue updates being sent to regular customers in the true Floppyshop tradition. These two staunch Atari supporters have been prepared to go out on a limb in order to ensure continuing support for the Atari Community. We trust you will repay them for their efforts with the same level of support you have always given us.

It was only natural that all rights to our Sounds & Stuff CD-ROM should revert to Electronic Cow as they were responsible for its compilation. A number of the other packages we sold in the last couple of years are still available through Atari Computing's readers offers.

The "Floppyshop Commemorative Site" is now on the Web. Funny how we had to close down to find time to finish the site! The main page leads to three distinctly separate sites. There's a potted history of Floppyshop in our "Ancient Burial Site" and and a quick roundup of the Atari Scene in our Contacts Site, finally there's the Virtual Christmas Party which is near identical to our Christmas 1998 site, suitably updated to take account of the changes which have taken place since then. "Our Virtual Christmas Party" site had over 1100 visits, we're looking forward to reaching our "second millenium" with this one!

All the information on our former releases can be found here as well as full contact information, not only for those whose who have taken over the distribution of our products, but also to everyone who's anyone in the Atari scene.

It's Been Fun, Of That There's No Denying. All that remains is to wish the Atari Community well for the future and thank everyone for their friendship and trust over many years. In the words of my late grandfather, Tom Delaney, Everything In Your Favour's Against You, but as an Atari user, you'll rise above such things and face the future with a courage and determination no PC owner could ever hope to match.

Thank you for everything, may you live long and prosper.

Goodbye from

Steve Delaney and Irene Lamb

Commemorative Site at http://www.floppyshop.cyberstrider.org

PS If you want to know what we're up to nowadays, our new company's site will be going live in a few weeks at http://www.mirrorimages.co.uk

>different ISPs (all under STinG of course).

I agree, but there used to be some variation of CPS for differing BPS rates.
With aFTP 1.51b I see an almost constant CPS of 1024 regardless of the BPS
rate I use. Please confirm if this matches your results for this version.

>aFTP is most prone to crash when uploading, too -- something that's

Correct. That is because aFTP is extremely sensitive to any deviation
in the TCP_close negotiation, even such as sometimes occur on Internet.
That is why the uploads often ended in crashes, and also why this was
much more frequent with LAN servers (both ends used STinG TCP_close).
That problem is fixed by the new TCP module in the STinG 1.20 release.

NB: It was still the fault of aFTP that any errors resulted in crashes.
They should have detected error states and aborted 'gracefully', but
since the new TCP prevents the errors from happening, the problem
does seem to go away even without updating aFTP. When any real net
errors do occur, aFTP failure to test for error states in some places
where they should may still cause crashes. I can't affect that...

>plagued me from the start, notably when doing them via a multiple
>drag-and-drop. It's bad enough the uploads are slow (by 4 or 5 times),
>let alone aFTP being unstable at the same time (perhaps this is
>related?).

If (as I think) the upload problem is due to an unsuitable design of the
main event loop, then this could easily lead to instability too, as well
as the 'lockups' that all aFTP users must have seen occasionally.

>But downloads have never been a problem as far as speed and reliability go.

Not a problem perhaps, but they do not achieve the speed that I know to be
possible. Downloading a file over the LAN using HTTP, with CAB at one end
and WebLight at the other, is usually more than twice as fast as doing it
over FTP, with aFTP at one end and FTP Server at the other.

>Although just as slow as the other betas, aFTP 1.3b1 is what I use on the
>TT -- running MagiC 5.11 -- because it's more robust, less prone to crash

>when uploading (haven't tried the latest beta, or the latest STinG for
>that matter).

Later aFTP versions have improved D&D interface and ascii-based config and hotlist files, that make manual editing of the files possible. This is the best way to rearrange a hotlist to suit personal taste, rather than the order in which the entries happened to be created.

Without updating to the new STinG release you can never make aFTP stable. That goes for all aFTP versions so far, including the current aFTP 1.51b.

>BTW, I brought this subject up with Peter in e-mail without getting a
>response.

He has told me he is fighting with the ISP (a University) over the right to keep his account (it was a student account I gather) after graduation. (He is now Dr. Peter Rottengatter.) So his access to Internet lately has been very sporadic (mostly nonexistent).

Before his graduation he was naturally pressed for time, studying for his exams and so on. Under such circumstances it is not very surprising if some E-mail went unanswered. Still disappointing for you though... :-(

>I even offered him my FTP account information so he could try it himself.

That was nice of you, but it wouldn't help if he didn't have time to do it.

>For me, uploading is the only consistent bottleneck --
>otherwise STinG is just as fast or faster than the Mac's Open Transport.

Good, and since the upload problems are _not_ STinG's doing, you can remove the 'qualification' from that statement. (At least for STinG 1.20)

----- snip ----- re: automatic hangup program for batch operation
>
>Surely this must be possible and wouldn't be more than a 30 minute job.

There is a real problem here. The dialer starts batches in sequential mode,
so the DIALER is effectively blocked from receiving any dial operation
requests during this time, such as a request to hangup. It is not a good
idea to let another program do the hangup independently of DIALER, because
then the pre-dialing routing etc may not be restored properly.

The problem can be solved for a future version, by making the dialer use
the NetD interface to implement the dial request server. This allows the
use of that server in parallel to the batch operations (even in single_TOS).

But I can't update the dialer myself, because Peter has the only dialer
sources, and I have not had any mail from him for quite a while now...

I do plan to write some short TOS/TTP programs to send dial requests, and
suitable for use in a batch program.

The 'hangup' program would just send a 'hangup' request to the dialer, at
the IP address specified by the DIALER entry in DEFAULT.PRG . Which for
the machine with the dial-up modem should always be set to 127.0.0.1 .

Correct usage will then be to first run the dialer on the modem machine,
and not dial out, but just leave it resident with windows closed or even
iconified. Thereafter the spawner program can be used, independently of
the dialer (and on any machine in the LAN) to start the sort of batch you
want, with the first program in the batch being a new 'DIALUP.TTP' program
that should of course be run in sequential mode. That will send a dialup
request to the modem machine, and await completion of dialup before it
exits to let the rest of the batch programs do their jobs.

This approach should work even without any modifications to the dialer.

For single_TOS the usage described above requires that the dialer be used
as an ACC (since it doesn't use NetD for the dial request server), which
means that one must avoid using the 'Exit' button (or ctrl-Q) in the main
dialer dialog.

>Also, can you run the oexport, oimport and oexpire.ttp programs from the
>spawner ? I haven't looked at the man files provided with Okami but this

>popwatch.prg
>newswatch.prg (both with appropriate switches)
>hangup.prg (yet to be written...)
>oimport.ttp
>okami.prg
>
>Can anyone confirm this ?

This seems functional to me. I can't really try it though, because my
Okami installation is not on the same machine as the modem. I'd have
to do it by running spawner independently of the dialer, and that is
not the same thing.

>Also, I haven't yet tried STinG 1.20, but what exactly are the
>advantages of it ?

There are many advantages, though most of them are not visible to a user
in the form of any new programs, or new dialogs in any old components.
Instead they deal mostly with internal improvements of kernel and modules
and some new ways in which they can interact with each other.

For example, a new interface function exists so that components that need
to change port driver settings can do so without 'digging' in the driver
structures directly, instead using the new 'cntrl_port' function to do it.

That is almost like a new extensible API for port control... Its effect
is to make STinG components less sensitive to changes in the structures
of port driver modules, and of the kernel itself, and also to increase
the safety against improper 'poking' in port structures, since no such
'poking' will be done when cntrl_port is used. Instead the specific
cntrl_port subfunctions added by the port driver to be controlled will
be called to do the job, which ensures that the code uses exactly the
same structures as the port driver does, since they are just different
parts of the same module.

Another, very important addition is the new TCP_close implementation that
allows proper TCP_close negotiation, which makes a _big_ difference to a
lot of clients. (Notably aFTP, which needs this to be stable.)

Also, the new TCP_close allows servers/clients to await the success/error
result code of a TCP_close negotiation in a fully unblocking manner, so
that they can keep working in their normal event loops while the negotiaton
is being made. (As yet no programs make use of this, but later some will.)

>and why isn't Peter Rottengatter promoting it himself ?

That is explained in some detail on my STinG support page. He has told me in a mail that he no longer has access to his old account, and is now fighting with the administrators to get it back.

Of course, I begin to wonder why he doesn't simply get a new ISP account, with some private company, so as to become independent of the old ISP... That is certainly what I would have done in his situation.

Meanwhile, I could not just sit back and watch the STinG community die. (Which it soon would if even more time had passed with no public update.)

That is the only reason why I 'took the reins'.
Any objections ?

>when you're ready to post?

Another possibility is to use a program that allows you to redefine the keyboard layout, and use an extended Alt-key combo for space. This will allow the space to be entered easily in virtually all software, not just a single editor like a macro would.

In fact, since the numeric pad keys have duplicates on the main keyboard you may even chose to make one of them (without Alternate key) the new space key. I'd then choose the '0' key on the numeric pad, since that is the key closest to the normal spacebar.

I think this is the best way to do it, apart from trying to fix the hardware itself, which might be tricky but is the only way to restore original spacebar functionality.

One keyboard redefinition program you may find useful is my UKEX.PRG, as released on my home page (URL in my SIG below). It is freeware.

To redefine the keyboard definition files you will need a good binary file editor, like HEX_EDIT or similar, or one of the specialized KBD file editors that are built into some other programs. The table structure of the files uses traditional Atari Standard with 3 blocks of 128 bytes each. An extra such file is used for the Alternate key definitions. In that file you may place a zero in any position, and that will then mean that UKEX will not patch the ALT handling of that key. This should be used to ensure compatibility with programs that use ALT key combo's for commands.

A number of different files for various nationalities are included, but it is only for the Swedish set (the one I use) that I have made an alternate key file. So you'll have to make your own...
It's not hard at all. Just copy my ALT_SWE.KBD file to a name like ALT_US.KBD or ALT_UK.KBD (UKEX will accept any ALT_*.KBD), and edit it to contain only zeroes (to get rid of swedish-specific stuff).

The result is a valid ALT key file, but one which does not change any key mapping from the normal usage. Now you need to make one key become used for space, and if you want this use to be independent of the shift,

control, and capslock keys, then you must enter $20 in the correct place of each of the three 128 byte blocks in the file.

An even easier method is to not use any ALT_* file, and simply edit the DEF_US.KBD or DEF_UK.KBD to contain $20 at the three positions, $70, $F0, and $170. That will result in the numeric pad's '0' key being redefined as a space key.

To install the stuff you just drop UKEX in the \AUTO\ folder, and also the KBD file(s) you want to use. The new keyboard will then be activated at your next bootup.

1798. Networking an ST

Newsgroup: comp.sys.atari.st
Date: 1999-04-28 00:00:00 UTC
From: Adam Foster <afoster@zetnet.co.uk>
Message-ID: <3727773D.9942FA25@zetnet.co.uk>
Source record: 79765

Hello...

I'm currently at university, but have an old ST at home which my mum uses for word-processing using Papyrus. I have this ridiculous plan of networking at least some of the computers at home over the summer - five PCs (three running Linux), a Belgian Mac Classic II (don't ask), the ST and a dead Spectrum. Networking the PCs will be pretty easy, but I was wondering what could be done with the Atari.

I've got a long null modem cable, and could probably set up a SLIP or PPP connection using STiK or whatever the latest is (I used to use STiK when I used the ST on the internet). Which telnet client would you recommend? And is there anything more complex available to run over TCP/IP, such as SMB capability or an NFS client? The ST's got a copy of MiNT on it (it hasn't been used for years though) so could I do something like this with MiNT-net? Or is there some (free) software available for TOS?

Thanks for any ideas...

I'd appreciate if you could send a copy of any reply to me by email, because the news server I'm on is very unreliable and tends to lose posts etc. Thanks...

>usualy get a upload speed of 3500 cps (with a V90 modem, 44000
>connection). I've once uploaded 80 files (4.4 MB) in one session.

I remember you mentioned this before, Martin. Because of this, I just assumed my slow uploads were due to aFTP being more MiNT-friendly than under MagiC. But now that Louis says uploads are just as fast on his MagiC system, I know there's something "not quite right" at my end.

What's strange is that under my new ISP (Sympatico), aFTP is faster during uploads than my previous ISP. Instead of 600cps for a binary upload I get around 1200cps (this based on a 28.8 connection). Uploading is actually slower than that, though, because it takes some time to get up to speed. Small files like GIFs aren't big enough, but with large files aFTP has enough time to slowly increase its throughput before it tops out.

No amount of tinkering (larger buffers, a different serial port, etc.) has made my uploads any faster. Yet my other connections with POPwatch, NEWSwatch and CAB are fast and reliable (as are aFTP downloads).

If it is true ASCII text then it does not matter which program produced it - it should be readable by all text editors on all platforms. If it is specifically Signum format (in which case it will have an .STX extender as far as I know) then you will need Signum or Script on an Atari to load the original and export ihe text as true ASCII. Papyrus can also be used and can export it in RTF (Rich Text Format) which retains the formatting information.

>decide to go FTP-ing, or surfing? OK, you can de-activate the batchfile
>before connecting with Dialer, but I found myself already on occasions
>that I wanted to use CAB for the session only, I forgot to de-activate the
>batchfile and the whole bunch started first.

Agreed. And this is a generic problem of most batch usage. It is not
acceptable to be limited to one single static description of what the
batch should do, because sooner or later the needs will change, and
will become variable.

>Using several batchfiles won't work since it's laid down in DIAL.SCR and
>that's what the stuff reads upon starting.

Logical inversion of parts of your statement solves the problem, like this:

Using several batchfiles will work since it is not laid down in DIAL.SCR as
that is not what is read upon starting.

Clarified: forget the batch mode built into the dialer, and its limitations,
and use instead only SPAWNER.PRG, since this is not so limited.

This requires development of some small TOS/TTP programs that can send UDP
dialup and hangup messages to the dialer APP/ACC, and these should not be
hard to write. I will do so shortly.

>The same applies when you want a prg to hangup. When? Upon completion of
>the mentioned prg's, then what if you decide to go surfin' afterwards?
>After somuch time of inactivity? Then what while surfin', you read
>something so the line is inactive, next you wanna go further and meanwhile
>Diaer hung up... :-(

All those problems are solved by the ability to use multiple batch scripts,
though you still can have such problems if you change your mind while the
script is running. That can be solved by letting the 'hangup' client look
for a 'hotkey' (eg: right shift key) when launched, and to abort itself
if that key is pressed. Thus you have the opportunity of changing your
mind right up to the moment the hangup.prg should do its job.

>old STX to get decent speeds.

The TCP module is the one that has the greatest influence on transfer speed,
since TCP is the dominant transfer protocol on Internet. Fortunately I do
have the latest TCP source code peter wrote before losing his account, and
so I was able to complete some of the work he had begun, and will be able
to continue improving and debugging it until Peter returns.

If I had not been able to support the TCP module properly I would not have
prepared the STinG 1.20 release, because that would have been pointless.
So we were a bit lucky there, in that Peter had already sent me the source
before losing his account.

>Finally, from what I gathered Peter lost his ISP account so he isn't able
>to reach us here. Good thing someone took over :-)

I think so (of course), but it would be even better if Peter could come back.
I am not able to support all components of STinG properly, since I don't have
any source files for most of them.

>using today's exchange rate... power without the price?

Actually, _YES_. For that time it was.
("But the times, they are ahchaaaaanging..." :-)

I remember when a RAM expansion board for, say $400, was a large S-100
bus board (appx. A4 size, like Atari Computing mags), containing a
massive RAM expansion of 4 KB (and yes, I do mean four kilobytes).

That was massive for a time when the major microcomputers available
to the public were delivered with only 256 bytes of RAM. Any more
required expansion boards, like the one mentioned above.

Any old figure quoted out of its contemporary context lacks meaning,
except to those who remember that context and can use it to evaluate
the meaning.

>connection). I've once uploaded 80 files (4.4 MB) in one session.

This further confirms my suspicion concerning the kind of error that ATACK
have made in adapting the aFTP event loop for use with the STiK/STinG API.

Evidently they have not understood how to construct an event loop so as to
make efficient use of the STiK/STinG API, and have therefore placed a limit
on the amount of data possible to transfer during each event loop pass.
The limit and the loop period have clearly been chosen to give a quotient
of 1024 CPS, which may seem OK to users of older modems at 14400 bps and
is not even visible as a limitation for modems using 9600 BPS.

The error is clearly visible however, when the same 1024 CPS is achieved
on a local connection using 153600 BPS ! (Capable of up to 15360 CPS.)

Such a method is totally unacceptable, and can not even be considered as a
serious attempt to make efficient use of the API. They should know better.

You don't tell which version of Signum! you are using. Signum!2 or Signum!3/4 ???
Try Papyrus [recent version, even demo-version will do for conversion purposes]
and use the right export filter [in the Belegung map]

The story is a bit more complicated than this if you use a video card version of NVDI.

For the Matrix TC series cards CHGRES gets its list of available resolutions from the F?*INF files in the MATRIX folder. For the Matrix CXX cards is uses the similar .CXX files.

I did try out the latest demo of Adamas, it still have some way to go before it will match CAB, but it did seems faster loading a page with gif and jpg pictures, and it shows em nice. The font handling leaves something to desire, in my opinion, but maybe I`m just spoiled by using CAB for so long.

Anyway, I am also waiting for someone to post a review of the Draconis suite "Online".

I did try out the demo of MagiC Mac, on the external drive, it`s works OK.
Guess I have to buy it some day.

>If you have MagiCMac and need to use the same drive on both machines and
>HDDriver won't let you do it, perhaps you'll have to back everything up,
>reformat the drive to Atari standards, then use it directly on the
>Falcon and via MagiCMac on the Mac.

That`s an option I rather be without, as I have plenty to back up.
Actually I don`t really need it, as I have a intern 3.25 Gb HD on the Falcon.
It`s just for transfering some MOV files that is to big to put on any disk
but a Zip or Jazz.

>
>But hopefully there's a way to read HFS formatted (Macintosh) drives on
>a Falcon sp you don't have to do all this.

Apperently not, according to Uwe`s post it is not possible for the Falcon to read
the Mac formatted harddrive.

>is ready to take two 060's as well. They switched to DIMM's too, good
>choice.

Yes, the Phenix looks promissing but also more expensive, not the power
without the price anymore.

I know it will never be like in 1986 where a Atari cost only half the price
of a PC and a 1/3 of a Mac, but is it the other way around now.

For the price of a Milan, without a screen, I can get a Compac 350 Mhz
with 64 Mb ram, a 6 Gb HD, a DVD 2 drive, 4 Mb ATI 3D grafic, 56k modem
and a 15 inch screen. If I spend 2000.00 Danish kr. more, I can get a 400 Mhz
Fujitsu with a 19 inch screen, but without the DVD drive.

The only drawbacks is, that they (the PCs) comes with Windows. And they don`t
have a Motorola inside :-))

I don`t considder a B&W G3 Mac, it still cost an arm and a leg.

cheers

>There is no way to use a Mac-partitioned drive with the Atari.

Hi Uwe, - if I use HDDRIVER to make it DOS compatible, will I lose all
data on the drive,- right?
That is, if I don`t make a back up before I do it.

I don`t need to boot from it, the Mac has a intern 250 Mb HD and the Falcon
has a intern 3.25 Gb HD. It`s mostly for moving files from one system to
another. Huge MOV files or FLI files.

I'm not sure about that; the GPL'ed GEM very probably predates TOS 1.62,
which had fairly substantial improvements to GEM, and is forcibly burned
into ROM. And there were more recent TOS/GEM "emulators" like Geneva,
which may have also passed over into "freehood."

Certainly XFree86 runs lots on other OSes. Ditto for SVGAlib, although
probably with lower incidence. I expect that GGI has a still lower
incidence of "running on lots of other platforms," which is not to say
that it couldn't/shouldn't run lots of places.

>
> Has anyone ever encountered this? Have my worst fears materialized?

Maybe not entirely, but the warning signs are there! :(

My disk in my Falcon died several weeks ago, although it didn't have
any warning signs. It just stopped instantly, tried to reboot several
times (spin up...make funny noises...spin down), and after several
retries to reboot it would stop altogether. HD-driver could still
poll the drive, get serial#, drive ID# etc...but no data will ever
flow from/to this disk again as the heads have crashed.

Your TT's disk could be on the way out, with the stepper controlling
the heads getting tired and old. My advice is to backup the disk while
you still can. At least when it dies, if it does die, you wont lose any
stuff...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

>Ahrg, mean aFTP.. Sorry

Yes, I noticed. But I think everyone understood what you meant.

Anyway, it seems that you are quite happy with aFTP 1.51b, which I am not.
It does work fairly well, though not quite as stable as 1.5b, but my real
problem with it is that it is _horribly_ slow for uploads. Even at a bps
rate of 153600 I still only get a cps of appx 1024 (almost precisely!),
and the very same CPS is what I get for most lower speeds as well. So the
bps rate has _no_ effect on cps, except when bps is lowered so much that
1024 cps becomes impossible.

This seems quite silly, and in such a way that I think I know what mistake
they have made in coding the event loop of aFTP 1.51b. Before I add that
info to the preliminary report I have already sent them, I want some more
confirmation from others that my view of the behaviour is correct and that
it is repeatable on all other STinG systems too (all that try it, I mean).

Please test upload behaviour and post the results.
(Not just Robert, but any others too who want to help out.)

Hate to say this BUT

the same thing happened to my TT HD. I had to swap it out with my
external drive that I had originally set up. Made it bootable first,
then switched it. At least it saved my system.

Get a SCSI drive somewhere while your HD still works.
Do a backup on disc, then switch it out.

Hope this helps

I have no idea what modem David has, but no modern modem should give
350-400 cps as the max rate. Occasionally some slow server may cause
cps to fall to such levels, but it should not be considered normal.

One possible cause is that the MSTe system is in need of 'tweaking',
to achieve better TCP fluency.

Here is some advice on how to do that:

Many problems with effective speed and TCP 'fluency' depend on some
unsuitable STinG timeslice setting. That is the 'Delay' entry in the
"STinG Internals" CPX. For fast machines (TT or accelerated Falcon)
this should really be 10ms, but even for slower machines that do not
work well with 10ms I do not advice using larger values than 25ms.
All machines, both fast and slow, should do fairly well with a setting
of 20 ms.

Another factor in 'fluency' of transfers is the buffer size used by
the HSModem modules. These should always be enlarged so as to be
able to hold a full packet of the max MTU size, and it is mostly a
good idea to have even larger reception buffers. I myself always
use transmit buffers of 4 KB and receive buffers of 16 KB. This has
worked fine for me. (HSModem default buffer size is only 256 bytes!)

NB: This can't be done properly with SERIAL.CPX. You must do it with
a SETTER program, as supplied in the HSModem distribution archive.

Finally, you may gain further improvement by choosing a suitable
TCP reception window size (RCV_WND in DEFAULT.CFG). This _must_
be larger than two MSS sizes, and I myself use "RCV_WND = 12288"
(12 KB that is). The other configurable values do not normally
need any user 'tweaking'.

Which overlay are you using? I can only get b/ground downloading (and autosurfing) using the IConnect overlay with the ASH stack, or Olivier Booklage's overlay with STinG. I've never been able to get Dan's overlay to work either of these two magics.

Did you get your STFax printing problem sorted BTW, I posted a message in here a week or so back.

Most STs came with TOS in ROM and therefore never needed a boot disk.
Only the very first ones needed one, most of which have either been
upgraded or retired. Try either leaving the machine on for a few minutes
without a disk in the drive, or booting with a plain DOS formatted 720K
floppy in the drive. Both of these should bring up the desktop.

If they don't, then yes, your ST probably needs a TOS disk. However
there doesn't seem to be a source for this anywhere on the net. I
suggest you upgrade the machine with ROMs from an old broken ST, or get
a TOS 2.06 upgrade.

Hi,

Could you please elaborate a bit on that? Any projected time of release (or is that just a plain silly question in a computer NG)? What more does it do? How compatible is it with "old" Stik? Would I just be able to exchange a few files and be up and surfing? I currently use "old" Stik, and have so far avoided the temptation to try Sting. I have seen posts of people having all sorts of trouble getting it going well. I have "old" Stik running fine for me now, but imagine it might be advantagous to be able to use PPP should my server decide to no longer cater to the needs of the couple of people still using SLIP. Obviously Atari users...ha-ha! ;-)

Thanks,

Note that you NEVER have to format a drive in order to change
DOS/TOS/Mac compatibility or whatever. Partitioning is ALWAYS
sufficient. Formatting is only necessary if a drive has bad sectors.

Well, I'm finally getting Okami to run the way I want it to. At least it would if I had paid my ISP on time ;-/

Anyway, all that seems to be left to be automated is the STinG Hangup function. Could someone who is familiar with the STiK API write a tiny little program that would disconnect STinG ? This way, you could add it to the end of a login.bat or a spawner.dat file.

Surely this must be possible and wouldn't be more than a 30 minute job.

Also, can you run the oexport, oimport and oexpire.ttp programs from the spawner ? I haven't looked at the man files provided with Okami but this should be possible. I think the correct order of execution would then be:

t_batclk.app (just to set the time or correct any drift from the RTC)
oexpire.ttp
oexport.ttp (ideally, these should be done offline, but well...)
popwatch.prg
newswatch.prg (both with appropriate switches)
hangup.prg (yet to be written...)
oimport.ttp
okami.prg

Can anyone confirm this ?

Will the Okami 2.0 ever be publically released ?

Also, I haven't yet tried STinG 1.20, but what exactly are the advantages of it ? and why isn't Peter Rottengatter promoting it himself ?

It sounds as if you are new to the net. You'll find tons of software on
FTP sites, including all the dearchivers you'll need. You need the
lharceng.ttp program to decompress lzh files. Get a nice shell to go
with it, like twoinone.

For starters, try

http://ftp.lip6.fr/pub/atari
http://www.umich.edu/~archive/atari/
ftp://193.190.205.13
ftp://ftp.funet.fi/pub/atari

There is a list of all the Atari FTP sites at

http://launchpad.atari.org

May I suggest you have a look at the Quick FAQ at

http://quickfaq.atari.org

> Please reply direct to nick@boroughloch.demon.co.uk
> Thanks

Nope, this has been said again and again, but if you take the time to
ask questions publically, and people take their precious time to write a
nice individual answer, the least you can do is go back to check the
replies. This for several reasons:
-Someone might have posted a similar question, so the answers might
already be there
-Someone might want to ask a similar question, so will probably
appreciate answers
-Usenet is not a write-only media

I suggest you document yourself on netiquette...

Every version of aFTP I've tried has *always* been very slow when uploading. This based on using three different local FTP sites with two different ISPs (all under STinG of course).

aFTP is most prone to crash when uploading, too -- something that's plagued me from the start, notably when doing them via a multiple drag-and-drop. It's bad enough the uploads are slow (by 4 or 5 times), let alone aFTP being unstable at the same time (perhaps this is related?). But downloads have never been a problem as far as speed and reliability go.

Although just as slow as the other betas, aFTP 1.3b1 is what I use on the TT -- running MagiC 5.11 -- because it's more robust, less prone to crash when uploading (haven't tried the latest beta, or the latest STinG for that matter).

BTW, I brought this subject up with Peter in e-mail without getting a response. I even offered him my FTP account information so he could try it himself. For me, uploading is the only consistent bottleneck -- otherwise STinG is just as fast or faster than the Mac's Open Transport.

Yeah! this happened to my Megafile30, so i switched to a SCSI 130Meg.

But I need another HDD for my other computer now! (Atari ST of course)

Can anybody give me a contact to buy a HDD in Sydney Australia?

PLEASE?

thanks - please email reply too

Peter

Why don't you just assign the space character to a macro or paste it
from the clipboard? Or search and replace the underscores with spaces
when you're ready to post?

IMHO this is because the price of PCs and MACs dropped down, not the
reverse way. I remember the price of my first 1040 STf, it was not that
cheap "stricto sensu"...

Bye,
/Pascal/

No, that should be OK. Blowup sets flags to specify modified resolutions
so sometimes you end up with mode codes >32768 or >16384. Videlity doesn't
seem to like those.

>and testing) is 672x512 - but it seems a bit flickery. So I've set it to
>656x496 which looks pretty good.

There are some monitors which don't seem to like refresh rates lower than
50Hz so the only way to get bigger screens is to go for Interlace mode.
This can be a bit fiddly as the interlace won't work on the Falcon if the
screen is too far to the right (The interlace just dies & you get skipped
lines instead).

Try this mode :-

X-Res 720
Y-Res 544
Hsync 157
Vsync 9
Left Blank 0
Right Blank 132

Upper Blank 8
Lower Blank 9
Interlace ON
Double Line OFF
Pixel size 1/4
Dot Clock 25MHz

This works rather nicely on my monitor but it's a funny multifrequency
thing.

>Thank you very much for your assistance!

Glad to help

: IP over 1284 (parallel port), and the adapter works with PCs, Amigas
: and Ataris.

Yeah, but that's not the same as Ethernet, though.
It's more like a faster version of PLIP.
If you want to see a real Ethernet adapter which also
uses the parallel port, try this URL:

http://atari.scum.org/

OK, it's not as fast as the Smartnet cable, and it's not really working
yet, but at least it's true Ethernet :-)

So would Atari Computing. We covered this as a news item a while back but despite several emails and sending them a copy of Atari Computing in the post we haven't even had a reply, which is very dissappointing because it looks like an excellent product.

If anyone does get a reply out of them or they're lurking anywhere hereabouts we'd be delighted to hear from you!

Hi,

does the system transport and send the individual msgs in plain ASCII as
well or does it convert them to ARC/ZIP/LZH files first to transport them,
then they are unpacked again and sorted out/imported by your reader?
In other words, just like the old mailer systems worked? Yup, that's a lot
faster. Saves you 60-70 percent on the transmission time...

That way Semper, combined with Hydra protocol, even running bloody ol'
IOSmail left Newsie way behind.

Exactly the same here. It also complains that it cannot create the log file,
but I didn't try to pin down the reason for this - perhaps it's a LFN issue
(I've pointed it to a LFN partition).

>This seems quite silly, and in such a way that I think I know what mistake

Seems to be repeatable here. Upload seems to be in fits and starts reaching
1024 cps tops.

Worst thing is that I loaded the previous version to retest, it flatly
refused to upload at all!

1863. FS: US: Happy Discovery Cartridge

Newsgroup: comp.sys.atari.st
Date: 1999-04-29 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7g8vj4$crd3@news.ajou.ac.kr>
Source record: 79698

Greetings Atari Folks,

I have a Happy Discovery Cartridge for sale.
It connects to the ST/STe cartridge port and
allows you to backup your ST software.
It should work on the Mega also but not sure on that.
I have used it on a 4meg STe Tos 1.62 with good results.
I think there where a couple of designs of this cartridge.
This cartridge is the larger one and allows a external 3 1/2
drive to be connected to it. It comes with a standard
drive cable to connect to the ST/STe external drive port.
It will work with 1 or 2 drives or more.
There is also a empty place for adding another female
drive connection on the cartridge. A pass thru to allow
another cartridge to be connected can be added as well.
Documentation and original disk software is included.
Also have some updated software on disks that allows
more backup options with the cartridge.
Price is $100.00 or best offer over $100.00
I will not sell it for anything less than $100.00.
However, I maybe interested in some type of trade
for Falcon software/hardware. But as with most everything
money talks louder. Overseas inquires are welcome.
Buyer pays shipping charges. If you have any
questions about the cartridge feel free to ask.
You can e-mail me at phantomm@kih.net

>Here is some advice on how to do that:
(snip)

Thanks to Ronald for his attempt to help. I tried his suggestions, again, but, as I expected, they didn't achieve anything.

My RCV_WND was set to 5000 amd increasing it made no difference.

Re HS Modem buffers - Peter Rottengatter spent a fair bit of time last year explaining to us why, provided the delay in the 'STinG Internals' CPX is set to a reasonable figure (i.e. small), large HS modem buffers are simply a waste of ram. I had them set to 512. I increased them to 1024 with absolutely no effect.

I tried changing the delay from 10 to 15 and 20 with no result.

My modem is a 28.8k. I use Serial 2 on both machines. With a good site the TT easily achieves 3,000 bytes/sec and much more if compression kicks in.

With an essentially identical setup the MSTe is struggling to achieve 400 bytes/second.

The receive data led on the modem tells the story. When the TT is running hot it is on continuously. The MSTe never achives this. The led pulses on and off rythmically.

This is just what happened with the February '98 TCP.STX for STinG 1.15 and just what was cured by reverting to the November '97 TCP.STX

Fine, but don't expect aFTP uploads to be any faster afterwards. They will
be safer with STinG 1.20, but the slow speed is a problem of aFTP itself.
Other FTP clients do not have that problem.

Hopefully ATACK will correct the problem ASAP.

1866. FS: US: ST/STE Game Software

Newsgroup: comp.sys.atari.st
Date: 1999-04-29 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7g940q$crd4@news.ajou.ac.kr>
Source record: 79701

Greetings Atari Folks,

I have some Atari ST/STe games for sale.
Each game contains the original disks, manuals, and box.
All are in very good condition. Most are like new.
All games listed will work on the STe except for Steel Talons
which is for the Falcon only.
Here is the list,

Ishar 3 ST/STe version.
Lure of the Temptress.
AutoDuel.
Ogre.
Zork II.
Beyond Zork.
Spell Breaker.
A Mind Forever Voyaging.
RBI BaseBall.
Epic.
Rampart.
SuperCars II.
The Secret of Monkey Island.
Plan 9 From Outer Space.
PowerDrome.
Total Recall.
Damocles.
Hot Rubber.
StormBall.
Wanderer.
Disciples of Steel.
Midwinter.
Last Ninja 2 (Back with a Vengeance).
Steel Talons *For the Falcon only.
PowerUp *ST thru Falcon.

I was going to price each game but decided to allow folks to
make a offer instead. You can make a offer for all games listed
if you would like to take em all at once.
If you are only interested in a few, then make a offer on each
game that interests you.
If you see something that you would like to purchase, I suggest
you think about how much you are willing to pay for it and e-mail
your offer. Best offer gets the item. Buyer Pays Shipping Charges.
You can contact me at phantomm@kih.net

Yeah, I just installed STinG 1.20 and uploads aren't any faster. That 1024cps ceiling with aFTP 1.51b hit me, too. Hmmm... all this time it was aFTP's fault -- no wonder Peter never responded to my queries (I guess it wasn't his problem in the first place).

But what about you, Louis? Are uploads with aFTP just as fast as downloads with STinG/MagiC?

>money talks louder. Overseas inquires are welcome.
>Buyer pays shipping charges. If you have any
>questions about the cartridge feel free to ask.
>You can e-mail me at phantomm@kih.net

Which cartridge is it? They produced 2, one big and one small? That's
why I've been after an external drive with a pass-through port on it;)

I have the big one, and it cost me an arm and a leg here in the UK! I
consider $100 US (around ï¿½62 GBP) as cheap!

I'd be very interested in any up-to-date back up parameters that you
have;)

Anyway, I'm going to stick my nose in, as it sounds like the big one;)

The cartridge can also hold a clock, the schematic shows what you need and the instructions are good; you could lose that clock cart.:)

On top of that it has room for 2 EPROM's for a cartridge. This is mainly for the use of A MAC emu. and has instructions how to fit AND software to read and write the disks.

Their is NO reason why a couple of DIL or ZIF sockets can be fitted and your choice of cartridge chips fitted instead.

The backing up of disks is this it's selling point. It can back up ANY disk from Amiga, PC, Mac. and Atari.. maybe more. What's more it can put the data into a file! Just think about all those hard to come by protected programs, being able to put them in a file and stick them on CD!!!

I don't usually stick my oar in on items other people have for sale. I thought it would be an idea to know what it CAN do from someone who has one and not just the seller.

1871. Atari STE ZIP Upgrade Board!!!!!

Newsgroup: comp.sys.atari.st
Date: 1999-04-29 00:00:00 UTC
From: Steve Stupple <Steve@steverosie.demon.co.uk>
Message-ID: <Y6+AxRAsUDK3EwFo@steverosie.demon.co.uk>
Source record: 79706
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,alt.atari,demon.adverts.uk.adverts.computer

Hi

I'm after any info on the STE ZIP upgrade board.

I've no idea on what it actually does! I do have a leaflet with
instructions how to fit etc. But it sounds a bit silly sticking in a
board that has 2 meg on it, into the 2 memory slots!!!!

What benefit or features does it do!! It seems to upgrade to 4 meg with
this board you remove all memory, slap in the upgrade PCB things and put
this other 2 meg on the ZIP board itself. It does seem to be a little
silly!!!!!

I've tried the number on the leaflet and I go the usual 'unknown number'
message. The (c) is Go Direct Limited 1993, the tech support number is
0480 (before the 1 day, 01480) 891171

Most of this is adressed in the Quick FAQ. You could use either STinG (a
modern STiK replacement) or MiNTnet to do this.

IMO the main issue is what will your mum do with a network connection to
your Linux PC or your Speccy ?

Hi Louis! ;-)

Never used Opusterm or Rufus...in fact, until you mentioned them-I
had never heard of them <smile>

I setup StarCall one time, looks like a very impressive comms
package. I did get it to support ANSI on my system, but in one
very small font. When I changed to a larger font, ANSI compatibe
it was not. Oh well...So for me, the best solution has been the
one and only "CoNnect". ;-)

I'm not sure whatever became of RIP. I know it became pretty
common on PC based BBS's, but wasn't it very slow? Seems like
redraws took forever.

See ya later! ;-))))

FWIW, I followed the link. Other than the email address, it looks more like an advertisement......nothing concerning the purchase of a MSTE.

However, beings I have no pride, I offer a MSTE-4/SC1224-340MB internal-HD/Keyboard and Atari mouse for $145.00. Keyboard might need one of the replacement rubber cup kits, depends on your fondness for Atari keyboards. No software other than the Atari Utilites will be included, however I have a wide selection of non-musical software, and if you ask nicely, I may dig through the many boxes to see if I have what you need for a nominal fee.

Add an ICD Link for $60.00 more
Add an ICD Link II for $65.00 more
Add a DEKA PC keyboard adapter for $50.00 more
Add a Monitor Master for $25.00 more
Add an SLM 804 Atari Laser Printer for $40.00

All shipping cost paid by purchaser.
My zip is 93555, so you can make a guess at shipping cost, which will be recovered C.O.D as I am not going to weigh the items before shipping, however payment for the hardware will be required to be sent in advance by money order or other certified means of payment in U.S. Dollars.

I see. The environment section of the SCR files is immediately above
the "DIAL_SCRIPT" separator that must separate preceding sections from
the login script section, even if that section is to be empty. I think
you may have damaged or removed the DIAL_SCRIPT separator line, in which
case the file is no longer a legal SCR file. That would make the dialer
refuse accepting the selection and keep the old entry in its filename
field.

I'm a bit confused that you say it works right after several attempts
though. It should not work at all, since a failed test should continue
to fail identically on repeated attempts. But such a situation is not
quite normal anyway, so perhaps this 'erroneous success' is actually
due to some untested loophole in the coding.

>I'm assuming that CAB is able
>to pick up the necessary proxy from the dialer as naturally enough clicking
>on "default addresses" from the "Proxys/Servers" menu clears any entries
>that were there, picked up from the default.cfg.)

It doesn't work that way. CAB doesn't know that STinG dialers exist
(and under STiK or I-connect they don't). I think CAB asks CAB.OVL
to get the addresses for it, and CAB.OVL uses the 'getvstr' function
to ask the STinG (or STiK) kernel what values the variables have.

The dialer on the other hand uses the 'setvstr' function to create or
redefine its variables. That is why it is perfectly legal to have
some identical variables in DEFAULT.CFG and SCR files.

All storage of and reference to settings is handled through calls to
the STinG kernel, so a specific name always refers to a single global
variable. The values in DEFAULT.CFG become defaults, valid before any

dialling is made, which can be very important for clients with offline
operating modes (eg: mailers, newsreaders, etc.), and even more so for
local servers. Then when the dialer activates a script, its settings
override any old settings from DEFAULT.CFG, as well as some from the
CPXs (some port and protocol settings).

>> or that the settings from that file do not take effect as you wish ?

It shall indeed, and I am certain that it will for you too. We must only
find out precisely why it has not worked for you as yet. Hopefully my
hunch about the DIAL_SCRIPT separator is correct, in which case it should
work once you restore that separator in each of your SCR files.

Good. I will send ATACK instructions for how to modify their event loop
such that good efficiency shall be possible under STinG (and STiK). Then
I can only hope that they pay more heed to this info than they do to any
feedback mail (often never answered).

>It also complains that it cannot create the log file,
>but I didn't try to pin down the reason for this - perhaps it's a LFN issue
>(I've pointed it to a LFN partition).

That is possible, even probable.

Btw:
In networking LFN (pronounced 'Elephan' :-) stands for 'Long Fat Network',
which is a quite important concept. But I assume this has nothing to do
with your use of the word (Long File Name ?).

Is LFN actually a real partition type, or is it just a convenient way to
speak about the 'longname' capable ones collectively ?

----- snip ----- re: more on aFTP upload problem
>

This matches my results exactly, so I am sending ATACK the info today.

>Worst thing is that I loaded the previous version to retest, it flatly
>refused to upload at all!
>
It could be some inconsistency in the CFG file usage. (or hotlist ?)
After all, version 1.5b introduced the new ascii file formats.

I still believe them to be important, even if they didn't make much
difference to you. That was partly because your values were already
changed from default settings (which I only learned today).

>My RCV_WND was set to 5000 amd increasing it made no difference.

5000 should be enough for good performance, assuming normal MTU/MSS
sizes. I use a higher value mainly because I get faster CAB transfers
with that setting. The effect differs between different clients.
(In CAB's case it is the CAB.OVL that is the real STinG client.)

>Re HS Modem buffers - Peter Rottengatter spent a fair bit of time last
>year explaining to us why, provided the delay in the 'STinG Internals'
>CPX is set to a reasonable figure (i.e. small), large HS modem buffers
>are simply a waste of ram.

To some extent I agree. STinG uses a very efficient way of buffering
data, based on its timeslice driven interrupt routines, and when this
is combined with RTS/CTS handshaking it makes very little sense to use
huge modem buffers. But it still makes sense to raise the size a bit
from the 256 byte default. (As you yourself had already done.)

The buffer sizes I told you to try, however, will also work very
well _without_ any handshaking at all (for the speeds relevant here).

I also think you must have misunderstood him a bit. You speak of the
'HSmodem buffers', obviously meaning both reception and transmission
buffers, as if they could use the same buffering strategy with equal
efficiency. This is wrong.

There is no risk whatever of a 'transmitter overflow', so transmit
buffers can be much smaller than reception buffers. Those on the
other hand depend entirely on the RTS/CTS handshaking to prevent
'reception overlow' errors. The size of the reception buffer is

the only controllable factor that can increase the safety margin.

This margin may not be so critical at the BPS of your modem, but it
shrinks at higher speeds, and then larger reception buffers can
become more important.

>I had them set to 512. I increased them to
>1024 with absolutely no effect.

512 should be enough at your BPS with RTS/CTS handshaking, but even 1024
is probably too small if there is any problem with the handshaking.

>I tried changing the delay from 10 to 15 and 20 with no result.

As I said, where possible the shortest delay is preferable.

An MSTe should not have any problems with this, since it is a 16 MHz
machine with RAM cache. It is just that I didn't know what delay
you were using when I wrote my advice. For all I kneu you could have
kept the original default setting of 50ms, which would slow things
down. Btw: Have you checked that the RAM cache is active ?

>My modem is a 28.8k. I use Serial 2 on both machines.

What bitrate do you use between computer and modem on the MSTe ?
And is that the same as on the TT ?

>With a good site the TT easily achieves 3,000 bytes/sec and much
>more if compression kicks in.

Ok, that sounds perfectly normal.

>With an essentially identical setup the MSTe is struggling to achieve
>400 bytes/second.

And that is not normal, so we must find a reason for it.

>The receive data led on the modem tells the story. When the TT is
>running hot it is on continuously. The MSTe never achives this. The
>led pulses on and off rythmically.

Ok, this is important stuff, so it is equally important that we try
to interpret exactly what this means. Bear with me for a while...

The reception led tells us what is coming in from the ISP, and from
results with the TT we know that it is capable of fully streaming
transfers. Yet something is preventing that, so what is it ?

I see three possibilities:

It can be an effect of TCP handshaking, in which case MSS and RCV_WND
settings should have some effect on it. What is your MSS size ?
And what is your MTU size ?

It can also be an effect of RTS/CTS handshaking forcing the ISP to
hold back from sending data even when TCP handshaking allows it.

But an MSTe should not have this kind of problem when configured
the way you say.

Finally, it can be an effect of RTS/CTS handshaking being in some
way misconfigured or physically ineffective. This would cause
lost packets whenever the buffer fills up completely, and then
those packets would have to be retransmitted. The lost packet
will not be acknowledged as received, and the ISP side will
stall when the RCV_WND size from that point in the data is
received, and after an internal timeout the lost data will
be retransmitted. This could cause the pulsing you see.

The TT would not suffer from any such problem, because it is so
much faster that it can easily handle this traffic even without
RTS/CTS handshaking.

A good way to test this is with a lower speed between the MSTe
and modem. With correct RTS/CTS handshake the low speed should not
increase packet losses, but without handshake such increase will
inevitably occur. Inspect them in the dialer's "Statistics" tool,
while downloading large files with CAB. Do this test with normal
speed between MSTe and modem too, so you can compare results.
The connection speed should of course be 28800 for both tests.

I will naturally look for possible problems in the TCP module, but
I find it hard to understand why they should only affect MSTe, when
many people can use both normal and speeded STs without problems.

Another interesting thing to know is if this problem affects all of
the ports identically. Have you tried networking the two machines over
MIDI ? (That does require fairly large buffers, since no handshake.)
This uses 31250 BPS, which is quite close to your modem speed.

Also, have you tried local networking with a null-modem cable between
the ports that the two machines normally use for the modem ?
I am mainly interested in the CPS you then get for various BPS.

>This is just what happened with the February '98 TCP.STX for STinG
>1.15 and just what was cured by reverting to the November '97 TCP.STX

Sorry, that tells me absolutely nothing about their differing content.
I don't have sources of all TCP versions. And since I can't get your
results here, It's hard to experiment with changes directly, since I'm
not sure of noticing improvements that could be significant for you.

Still, I'll try a few things anyway... If I find anything promising,
and the beta-testers also think it works well, I'll add an update
archive to my pages and post a note about it here.

>aFTP's fault -- no wonder Peter never responded to my queries (I guess it
>wasn't his problem in the first place).
>
>But what about you, Louis? Are uploads with aFTP just as fast as
>downloads with STinG/MagiC?

Neil, just tested it on my new stuff: downloads soaring 3500-4000, but the upload started high initially and dropped down to a little over 300 after a few secs. I recall having used older versions of aFTP (1.2 or 1.3) the last time I transfered files to my homepages. With the 14K4 modem it was quite normal speeds.

Got another problem here: I received my LAN-RS232 cable, connected it, set the CPX to Ser2/LAN at 115200, changed the dialer config to Ser2/LAN and it won't work at all. I tried several bps settings from the highest down to 38400, but no go. So I'm back on Modem-2 38400. I figure I'll have to solder the Serial-2 connector myself to the pins on the board.

Uwe Seimet a *crit :

> I can't imagine that it's a problem to by a SCSI hard disk drive in
Sydney.

Hi Uwe !
I take the opportunity to ask you if it is possible or even counselled to
use wide scsi harddrives on atari machines ... I have heard it was possible
to use such devices by using an adaptor between our good old 50 pins scsi
interface and the new wide scsi interface type ...
What do you think about ?
I also ask this because today it becomes difficult to find SCSI 1 harddisks
...

Thanks for any answer.

Doctor Clu (clu-da-bard@geocities.com) wrote:

: I was wondering what Atari terms programs support ANSI (besides Freeze
: Dried Term) and if any supported RIP term?

Now _there_'s something I haven't heard in a while...
Yeaaars ago (we're really talking medieval times here) I decided to write a RIPterm for my ST, in GfA Basic. I didn't have the time or the programming experience to do it properly though, and it was pretty hard to get some decent docs on anything Atari-related on FidoNet and the few local BBSs which suported Atari. So I gave up after a while, especially as someone else had already released a RIPterm for the ST. I once tried running that one, but it was crap. Monochrome only, didn't support half the RIP commands and generally didn't work -- I couldn't even get the thing to call my local BBS...

I don't think the problem is on your side. The problems you and others has
with the STiNG version aroused my curiosity so I installed Sting 1.20.
I can confirm that aFTP STiNG version only upload at 1024 cps.
With MiNTnet and aFTP MiNTnet I could upload the same file to the same
server at 3500 cps.

I'm glad to say that Wolfram Roesler and I have come to an agreement
about the further development of Okami.

I will continue developing the program and am allowed to distribute it
on my own terms.

This means that version 2.0 can now be officially released. You can
download it from

http://www.xs4all.nl/~josdb/okami.html

There will also be a beta test version 2.1 up soon.

Another way, and a very much cheaper one if you don't already have Papyrus, would be to use QED. All you need to do is load the file, select the menu option file->info, click the Apple button and save it back out.

Subject: In Search of JIm Kent?
Organization:
Newsgroups: comp.sys.atari.st
Summary:
Keywords:

I am still impressed by Cyber Paint ADO effects and I am wondering what Cyber Paint Programer JIM Kent is doing these days. Could we find this genious :) ? and if we find him could we get it to post Cyber to Falcon so that it could work in high ress?

For those of you who never read the Cyber Paint Manual, Cyber can process a frame or even a complete animation over a any number of frames. It can rotate , move , enlarge , reduce and apply multiple effects all at once to a frame or sequence in a single pass and it does this veryfa st. Cyber is really a very powerfull animation Studio and its only limitation is that it works in med. ress only. I dream of having a program Cyber Like in high ress for Falcon! (Apex is missing Cyber's ADO effects)

Hi Bram,

not a stupid question at all :-) I simply forgot. Trouble is, even after correcting this, no go either. The port simply doesn't communicate, when I start up StarCall the modem won't respond either. Could be the cable's not what it's supposed to be (perhaps some connections wrong? It's a LAN to RS-232 25-pins connector, specified MAC LAN to modem).

Like I said, I'm afraid I have to open up the case again, and fix this flatcable from the motherboard J-somuch pins to a connector.

Anyone in here who uses the LAN-connector to connect to a modem???

1895. Freeserve & STiNG problems...

Newsgroup: comp.sys.atari.st
Date: 1999-04-29 00:00:00 UTC
From: ashley.seabrook@zetnet.co.uk
Message-ID: <3728e1cb$0$354@znews.zetnet.co.uk>
Source record: 79730

It has come to my attention that several people, including myself are having problems connecting to the Freeserve ISP using STinG :-(

I had no problems until a few weeks ago, but now STinG connects okay, but then does not initialise the connection perhaps 90% of the time, sometimes leading to dozens of attempts to get on-line :-(

I am using Roy Goring's scripts from his web page, but the scripts on the cover disk of AC#13 fare no better :-(

Any solutions anyone?

Thanks in advance,

Ashley

Hi Raymond,

This would be great. I have most all of the Cyber Series software
which is indeed powerful. I'd love to be able to use Cyber Cad 2.0
and etc. on the Falcon. With the ability to create objects, animations
and etc. in 256color and TrueColor.

I thought I heard at one time that some of the cyber stuff was to be
fixed for the Falcon, not sure on this.
If the Author will not or can't update the Cyber Stuff for use on the
Falcon. Maybe the authors will allow someone else to update it all.

1899. draft guidelines for comp.sys.atari.announce posts

Newsgroup: comp.sys.atari.st
Date: 1999-04-29 00:00:00 UTC
From: Kevin Savetz <savetz@northcoast.com>
Message-ID: <290419991802075048%savetz@northcoast.com>
Source record: 79734
Cross-posted to: comp.sys.atari.announce,comp.sys.atari.8bit,comp.sys.atari.st

As the new moderator of comp.sys.atari.announce, I feel it is necessary to update the newsgroup's guidelines regarding what types of posts are appropriate. What follows is a draft of those posting guidelines. Of course, I welcome feedback regarding this document. After discussion of any issues that are brought up, the final version of the document will be posted. Please send followups to comp.sys.atari.8bit.

comp.sys.atari.announce began as a newsgroup intended only for hardware/software product announcements. Atari-related products are a rarity these days, which is one of the reasons that the newsgroup has languished in recent years. The focus of the newsgroup is widening to allow any news relevant to Atari computers. For instance, announcements about Atari Web sites and events are now appropriate.

Following this draft, I've included the original posting guidelines that were written when the newsgroup was chartered. I have tried to keep changes to a minimum, while expanding the focus of c.s.a.a and increasing readability of the document.

Kevin Savetz
savetz@northcoast.com

** Guidelines to posting to comp.sys.atari.announce **

comp.sys.atari.announce is a moderated newsgroup. In order to be approved, posts must offer news relevant to Atari computer users.

What kinds of posts will be approved?
* Relevant to Atari computers: 8-bit, ST/TT/Falcon, Portfolio, Atari PC clones, or clones of Atari computers.
* Topics may include software, hardware, Web sites and other Internet resources, events and other news relevant to Atari users.
* Commercial posts and press releases are acceptable.

What kinds of posts will not be approved?
* Any post that is not relevant to Atari computer users.
* For sale posts are generally not approved unless they come from a developer or dealer that wishes to announce new pricing or product. Sale or auction announcements from end users will not be approved unless they are, for some reason, extraordinary.
* Posts that are not informative.
* Posts that are not in English.
* Posts that aren't reasonably understandable (due to, for instance, significant grammar problems or spelling mistakes.)

How do I post a message?
* Simply use your newsreader to post your message to

comp.sys.atari.announce.
* You may cross-post to other, relevant newsgroups.
* Alternatively, you may e-mail your post to csaa@savetz.com
* Your post will be reviewed by the moderator, usually within 24
hours. If accepted, it will then be posted to the newsgroup. If it
is rejected, you will receive an explanation via e-mail.

How do I follow up to announcements?
* Followups to c.s.a.a announcements should be posted to
a relevant Atari discussion group such as comp.sys.atari.8bit or
comp.sys.atari.st. Followups should not be posted to c.s.a.a.

For your reference, below are the original posting guidelines that are
being replaced.

*** begin old guidelines ***
Guidelines to posting to comp.sys.atari.announce

if you have any questions or comments/suggestions
please respond to myself or reply.

This file should assist users who wish to post to comp.sys.atari.announce
and are not exactly sure if it will be approved:

When posting to comp.sys.atari.announce please make sure of the following:
* post about atari computer relevant topics
* please include an explanation to what the package/machine is in the post
* the post should be at least 10 lines long (message content)
* it should be informative

* What kinds of posts will not be approved?
Any post that is not relevant to atari computers (8-bit, 16bit/clones) will
most likely not be approved.

Details are in the charter, in general posts that sound like "there are some
news, please contact me" without any information on the product in question
will be rejected. Posts that appear to have a lot of spelling mistakes will
most likely also be rejected (such as fairly obvious grammer and spelling
errors). Posts are expected to be in english, if they are in another language
then a translation would be nice, its hard to approve anything that one can't
read.

*Can I post forsale posts?
Forsale hardware posts are generally not approved unless they come from a
company/developer or dealer who wishes to announce new pricing for product.
Comp.sys.atari.announce is not atari.marketplace (doesn't exist however).

* Justification/Charter
Please read the RFD, this should clarify a lot of questions, if you have any
more questions please email me (ysiu@lexicor.com)

Original Request for Discussion: comp.sys.atari.announce

by: Yat Siu (Lexicor@world.std.com)

Group name: comp.sys.atari.announce
Status: moderated (Lexicor@world.std.com)
Distribution: world-wide
Summary: a newsgroup for the product announcement of atari computer
hard and software or related (eg. clones).

Justification:

There are currently comp.sys.atari.st, comp.sys.atari.st.tech,
comp.sys.atari.8bit and comp.sys.atari.advocacy, the first three groups
are discussion forums for their (specific) related hard and software. Product
announcements in these discussion forums of new releases by either commercial,
shareware groups can often be considered a service but not encouraged. The
atari computer market is not very widely distributed and it is getting
increasingly harder to know more about new products.

To begin with a product announcement group would encourage the
people to announce their new products for the benefit of all atari computer
users. It will also allow the reader to focus for a new newsgroup only for
product announcements or press releases and will also make the reader more
aware of his/her options.

Charter:

The proposed group will provide a forum for the announcement and
release of new atari related products:

* atari computer hard and soft
* commercial as well as shareware or related
* announcement from individual authors, companies or distributors
* press releases

NOTE

This RFD is being issued in concordance with the guidelines set in the
"How to create a new usenet newsgroup" FAQ regularly posted to
news.announce.newgroups. Please refer to this article if you have any
questions about the newsgroup creation.

Unless the discussion indicated a need to resubmit a new RFD, the CFV will
be posted approximately three to four weeks after the posting of this RFD.

This RFD was (cross)-posted to the following groups:
news.announce.newgroups, news.groups, comp.sys.atari.st, comp.sys.atari.8bit
*** end old guidelines ***

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! And if I don't have what you want to buy or I don't know the answer to your question, I'll refer you to someone who does. That's the nice thing about the Atari community and my colleauges in the Atari business. We would rather send our business to a fellow competitor to get what they need than have someone abandon their Atari due to lack of support. For myself, I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my DeskTop Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with NewsGroups.

I've just added to my ST SoftWare Catalog 30 more titles. All brand
new. In my ST software catalog new titles are listed at $15. Just like
BattleZone below. But for a limited time the $15 titles ar on sale for
$10. So go ahead and check it out. All of these titles are *NEW.

BattleZone; Atari;
Color or MonoChrome Monitor. One or
two players. Full 360 Degree action.;
*NEW.....$15.00 U.S.

Well have not ventured into this market before but what the heck?
Congratualations on your up coming wedding. How does your future bride
feel about your bad habit? I would not want to be the one that comes
beteeen you and your new Bride!

You could send myself your wish list, I will do what I can to produce
the product in a Clean Used condition. However if your new bride to be
sends me e-mail canceling your request I would have to honor her request
before yours!..Are you sure you are ready for this leap?

bob

1904. Re: Best Newsreader

Newsgroup: comp.sys.atari.st

Hallo Louis!

L>does the system transport and send the individual msgs in plain ASCII
L>as well or does it convert them to ARC/ZIP/LZH files first to transport
L>them, then they are unpacked again and sorted out/imported by your
L>reader?

The system collects all mail and news messages into one big ascii file called
OUTFILE.TXT. This one will be compressed and then sent to the user at full
modem speed as soon as he calls the BBS.
As a BBS system, mail/news transport is not as fast as in usenet, but every
mail/news will reach its destiny within less than 24 hours.

mit freundlichem Gruï¿½ aus Bubenreuth

Ekkehard
